throughout the country. It is an excellent manifesto from the Society to the gardening community, and the committee would do wisely to print and circulate it in pamphlet form. The motion for the adoption of the report was seconded by Mr. Richard Dean, and carried. Messrs. N. Cole, E. Berry, W. Dickens, and G. Kelf were elected upon the committee for the ensuing year. Mr. W. Collins was re-elected Secretary for the ensuing year, and the sum of £20 was voted to him from the Management Fund for his past services. Mr. J. Hudson was re-elected Treasurer; Messrs. J. George and J. and G. Wheelers as Trustees; and votes of thanks were passed to them, and also to the auditors, Messrs. Green and Dixon. Some conversation ensued as to an offer made by Mr. N. Sherwood, the Chairman of the last annual dinner, to subscribe £25 towards a Convalescent Fund. A resolution was passed referring the matter to the committee to prepare a scheme, and the proceedings closed with a hearty vote of thanks to the Chairman.

NATIONAL DAHLIA SOCIETY.—The annual general meeting of the National Dahlia Society was held at the Hotel Windsor on the 11th inst. Mr. E. MAWLEY, presiding. Among those present were Messrs. H. Turner, T. J. Saltmarsh, W. H. Williams, J. Walker, J. T. West, W. Holmes, A. Rawlings, J. Cheal, J. Tranter, and T. W. Girdlestone, Hon. Secretary. The minutes of the last meeting having been read, the Secretary read the annual report, which spoke of the newly formed Society having passed through a very successful season; the exhibition held at the Crystal Palace in September last having been a remarkably good one; the special Centenary class securing a thorough representative collection of every form and type of the Dahlia. The Centenary Conference was also well supported, and some excellent papers were read. The receipts from all sources amounted to the sum of £160 5s. 6d., including £50 given by the Crystal Palace Company. The expenditure was £135 5s. 6d., including £125 3s. paid as prizes, leaving a balance of £25 carried forward to the present year. The Hon. Secretary reported that he had arranged with Mr. Hogg that the annual exhibition should take place at the Crystal Palace on September 5 and 6, on the same conditions as in 1879, the company making a contribution to the funds as usual. This arrangement was approved by the meeting. It may be stated that only members of the Society can compete for the prizes offered in the schedule. It was resolved, after some discussion, that the papers read at the Centenary Dahlia Conference in September should be printed and circulated with the report and balance sheet. The name of Mr. John Lee was added to the list of patrons. The Rev. Charles Fellowes was re-elected President. Dr. Hogg, Dr. Masters, W. H. Callingham, H. Glasscock, J. Shirley Hibberd, and W. Keith, Vice-Presidents; T. W. Girdlestone as Hon. Secretary and Treasurer; and the following were appointed the Committee for the ensuing year—Messrs. W. H. Aphorpe, J. Burrell, H. Cannel, J. Cheal, J. Douglas, G. Gilbert, J. Henshaw, W. Holmes, G. Paul, A. Rawlings, T. J. Saltmarsh, J. Tranter, H. Turner, J. Walker, T. S. Ware, J. T. West, and W. H. Williams. A hearty vote of thanks was passed to Mr. Girdlestone for his services during the past year; who in responding stated that one of the Vice-Presidents, the Secretary, and a member of the Committee had been invited to read papers at the Dahlia Conference, to take place at Chiswick in September next. The schedule of prizes which had been to some extent re-arranged by Mr. Girdlestone, was then considered and passed with a few alterations. It is somewhat extended as compared with previous years, and it now appears to be of a thoroughly representative character. A vote of thanks to the chairman concluded the meeting.

THE LATE PROFESSOR MCNAB.—An influential committee has been formed in order to raise a memorial fund for the benefit of the widow and five

children of the late Professor McNab of Dublin. There are many who will sympathise with this movement, and feel that the family of a distinguished scientific man should not be allowed to suffer from circumstances arising out of a life-long and disinterested devotion to pure science. The Hon. Secretary is GREENWOOD PIM, Esq., Easton Lodge, Monkstown, co. Dublin, to whom all communications should be addressed.

ROYAL BOTANICAL SOCIETY OF BELGIUM.—Professor VON THEGHEM of Paris, and DR. MASTERS of London have been elected associate members of this Society, in the room of Professor REICHERTACH and M. LESPEROUX respectively.

LINNEAN SOCIETY.—An evening meeting of the above society will be held on the 20th February, 1890, at 8 p.m., when the following paper will be read:—"On the Fruit and Seed of Juglandaceæ; on the Shape of the Oak Leaf; and on the Leaves of Viburnum," by Sir JOHN LEBNOCK, Bart., F.R.S., F.L.S., &c.

ANTWERP.—The International Exhibition of Geographical, Commercial and Industrial Botany, which is to be held a general exhibition of all subjects relating to the microscope, announced for the present year, is to be postponed till 1891. M. DE BOSSCHERE is President, and Dr. VAN HERCK Vice-President, and M. CHARLES VAN JEFFER the Secretary.

LONDON PURPLE.—If we suggest that dealers should advertise their wares, we shall at once be considered to have interested motives—well, we have—the following narrative will show why. Our American friends make large use of various preparations of arsenic and other substances for spraying purposes, either for the attacks of insects or of fungi on various crops. We have repeatedly mentioned the fact, and urged our orchardists to adopt the methods employed with so much success in the States. Among other things, we have detailed the use of "London Purple." Some of our correspondents, attracted by our frequent reference to the subject, at length wrote to inquire what was "London Purple," and where it could be had? We knew or surmised it to be an arsenical preparation, and mature that we should find reference to it in the authorised dictionaries of chemistry and pharmacy. But no! not one word could we find about the substance though it was evidently used on a very large scale. Finding books useless, we applied to our chemical friends, to scientific chemists of high repute, to manufacturing chemists, to pharmacists, but all to no avail, till at length Mr. Housley, of the Pharmaceutical Society, was good enough to put us on the right track. But in the meanwhile, finding that in London we could get no information as to "London Purple," we thought ourselves that there was a London in Canada; and still later we bethought ourselves of our excellent correspondent Prof. RILEY, the Director of the United States Entomological Department, and he, with his customary kindness, gave us the information we wanted, adding that HEMINGWAY & Co., of London, aniline dye manufacturers, have given the name in contradistinction to Paris Green, and have established a branch house in New York, the sale of this valuable insecticide being, it is believed, one of their most important transactions. Two reflections occur to us on this story, one is that manufacturers should advertise (in the *Gardener's Chronicle*, of course—anywhere else they like), the other is, that this is one more illustration of the abominable time-wasting, trouble-giving, truth-concealing nature of "popular names"!

— This powder is obtained in the following manner in the manufacture of aniline dyes: Crude coal-oil is distilled to produce benzole. This is mixed with nitric acid, and forms nitrobenzole. Iron filings are then used to produce nascent hydrogen with the excess of nitric acid in the benzole. When distilled, aniline results; to this

are added arsenic acid, to give an atom of oxygen which produces rose aniline, and quicklime to absorb the arsenic. The residuum, which is obtained by filtration or settling, is what has been denominated "London purple," the sediment being dried, powdered, and finely bolted. The powder is, therefore, composed of lime and arsenious acid, with about 25 per cent. of carbonaceous matter which surrounds every atom. Experiments which we made with it in 1878, says Professor RILEY, impressed us favourably with this powder as an insecticide, and its use on the Colorado Potato-beetle by Professors BIRD and BESLEY, of the Iowa Agricultural College, proved highly satisfactory. We were, therefore, quite anxious to test its effect on the Cotton-worm in the field on a large scale, and in the winter of 1878-79 induced the manufacturers to send a large quantity for this purpose to the Department of Agriculture. The analysis made of it by Professor COLLIER, the chemist of the Department, showed it to contain:

	Per-cent.
Rose aniline	12.44
Arsenic acid	43.65
Lime	21.84
Insoluble residue	14.57
Iron oxide	1.16
Water	2.27
Loss	4.97
	100.00

Through the liberality of the manufacturers, Messrs. HEMINGWAY & Co., a number of barrels of this powder were placed at our disposal during the season of 1879, and distributed to various observers and agents in Georgia, Alabama, and Texas. Early in the spring of the following year, Mr. A. R. WHITNEY, of Franklin Grove, Ill., found it to be a perfect antidote to the canker-worms, which had not been prevented from ascending his Apple trees."

STOCK-TAKING: JANUARY.—With fearful weather at sea and the present high price of money, we may come to the conclusion that not only are arrivals backward, but that accumulating stocks are being worked up. We are the more inclined to this view from the fact that the exports of foreign and colonial produce show a decrease of £831,607; whilst those of our own produce and manufacture show the splendid increase over the corresponding period last year of £1,059,715. The following is an excerpt from the summary of the imports of foreign and colonial produce for January, 1890:—

	1889.	1890.	Difference.
	£.	£.	£.
Total value of imports	38,068,318	38,143,850	+ 75,532
(I).—(A.) Articles of food and drink — duty free	11,293,681	10,235,201	- 868,380
(B.) — do., dutiable	2,182,327	2,257,091	+ 74,674
(VI). Raw materials for textile manufactures (including Flax, Hemp, and Jute)	11,310,512	11,925,108	+ 614,596
(VII).—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,761,918	2,651,310	- 109,708
(IX).—Miscellaneous articles (including China Grass, Flax, Rape, Linseed) ...	1,771,690	1,565,881	- 205,770

An evening contemporary inquired a short time since why it was that, towards the close of last year, we had to record a falling off in the supply of Potatoes? For instance, there were 22,000,000 visits paid to the Paris Great Exhibition; and, for months, the consumption of "the noble tuber" in the gay capital must have been enormously in excess of the usual record, and the City netted a good round sum in the matter of *octroi*. The home stocks must have been worked up; also, "vegetables, raw, unnu-

merated," may have been affected by this cause. Then there were disturbances in the labour market here; for instance, at the docks; also a good crop here, and short ones elsewhere. The following extracts from the general returns have their usual interest:—

	1889.	1890.	Difference
(H. Fruit:—			
Apples, raw bush.	243,263	291,880	-41,385
Unenumerated, raw	11,894	14,410	+2,606
Onions	310,762	279,255	-61,507
Potatoes cwt.	51,415	15,722	-35,693
Vegetables, raw, unenumerated Value	£36,831	£31,601	-£5,230

It has been stated by the contemporary before alluded to, that the consumption of Apples is on the decline, it being recorded at the same time that the acreage in fruit trees in this country has risen from 90,000 in 1830 to 214,000 in 1889. The statements do not prove the sufficiency at one time and insufficiency of supply at another. Possibly, as with Potatoes, so with Apples, and that next season foreign crops have already to some extent been looked after by speculative financiers. In future, as our trees are better grown and the fruit better marketed, we may not be so dependent on the States and Canada for our supplies. More labour might possibly be profitably bestowed on the soil were the conditions of holding land different, and the labour market not so much disorganised as it is. Perhaps the German Emigration and his advisers will be able to excogitate a remedy for labour disquietude less open to question than that of supporting one industry at the expense of all the others.

THE MILDNESS OF THE SEASON IN THE FAR NORTH.—The weather has been hitherto unseasonably genial, bringing into flower many plants which really belong to the spring months. The following twenty different plants have flowered, says Mr. J. WEBSTER, in the open air at Gordon Castle, Banfshire, since January 28th: Scarlet Rhododendron, in flower; Rose Safrano, from a south wall has given flowers for cutting throughout the winter; some H. P. have done the same; Berberis Darwinii, Mahonia Aquifolia, Cilanthus from a south wall is showing flower trusses; Campanula cardinalis, Scarlet Trumpet Honeysuckles has flower trusses; Summer Franc Real Pear is in bud; Schizostylis coccinea, Pyrus japonica, Escallonia rosea on a south wall; Geum coccineum, Arabis alba is in bloom on the rock-work; Anemone pulstris, Anemone double Pink, and Heath in a border; Filbert, with both catkins and flowers open; common Alder, the catkins, just opening; Apricots are in blossom on an open wall with a south aspect; various Primulas are in bloom. The Apricot was one day later than it was in 1874, February 7, and that was the earliest in Mr. WEBSTER'S record of these facts, which he has kept for thirty years.

NEW ZEALAND.—We have received an interesting pamphlet, containing two addresses by the President of the Chamber of Commerce in Canterbury, New Zealand, given in the years 1886 and 1889, which by comparing the condition of the colony in these years, satisfactorily shows that New Zealand in the intervening period made material progress in everything that conduces to the prosperity of a British colony.

AGAVE RIGIDA.—The abnormal prosperity which Yucatan is enjoying is entirely due to the successful culture of the "Henequen," or, as it is generally termed, the "Sisal" plant of commerce, which yields one of the finest varieties of hemp extant. The population of the whole Republic of Yucatan does not exceed 3,000,000 souls, but the value of the "Sisal" crop annually exported exceeds 10,000,000 dollars. There is an unlimited demand for the article in Europe, as well as in the United States, where it fetches from £50 to £55 sterling a ton,

The plant, we are told, is indigenous to the country and grows wild. It is easily propagated, and will thrive in the worst soil. In fact, it does best in rocky and impoverished ground, where nothing else can be grown, and in such situations it yields the best fibre. It cares nothing for drought; cattle have an objection to it, and avoid the spots where it grows. It suffices to dibble in the young plants in any barren and exposed plot of ground. Three years after planting, the leaves are large enough to furnish a supply of fibre, and then the plant yields abundantly for fifteen or twenty years. The produce of an acre of land is estimated at 1000 lb. to 1200 lb. of clean fibre, and the money value of this produce is estimated by a Jamaica planter, who has spent several years in growing Sisal in Yucatan, at 80 dollars or £16 sterling. But if all this information is correct, why should not an attempt be made to cultivate the Sisal in India? Everybody cannot emigrate to Yucatan to try his fortune there; so it would be preferable to begin by trying if Sisal cannot be acclimatised in India. The climate is not dissimilar, and there is a fine area in the Southal Parganas where an experiment might be made on the rocky, barren, and exposed soil which the Sisal is said to love in Yucatan. According to Mr. BAKER, the three plants yielding the Sisal hemp of commerce are varieties of *Agave rigida*. Full information respecting this hemp has been published in recent numbers of the *Kew Bulletin*, a note embodying all known on the subject appeared in one of the earliest numbers, No. 3, for March, 1857, and additional notes as recently as March and again in October of the past year. It may be as well here to quote the *Kew Bulletin* for March last as to the prices for Sisal:—"The market value of this class of fibre, and the permanency of demand for it, has been fully investigated at Kew, and in a note on p. 3 of the *Kew Bulletin* for April, 1857, there is a summary furnished by Messrs. DEE and CURRIE which gives the average price per ton for Sisal Hemp in London for the years 1879-86 inclusive. The highest price paid was £32 10s. in December, 1879, to February, 1880; the lowest price was £17 15s. in January and February, 1885. *Proc. Agri-Horticultural Society of India.*"

DINNER-TABLE DECORATIONS.—At a dinner recently given in Washington, a space in the centre of the table nearly 40 feet long and 8 feet wide was sunk, so that the 600 Ferns in pots with which it was filled rose but a short distance above the tablecloth. Numerous small electric lamps were scattered under the Fern fronds—no other lights being used in the room—and the effect is described as charming.

APPLES AND CLIMATE.—Mr. JOSEPH CHEAL, of Crawley, Sussex, in replying to some strictures on the English climate in the *Times* of January 20, said, as to the suitability of our climate, with all its failings, for Apple culture, the following figures may interest some of your readers as to the crop taken from one Apple tree during a period of ten years. The facts I know to be correct, as they were furnished me by this friend, an Essex farmer, who planted the tree himself in November, 1871. The variety of Apple was the "Warner's King," and the form of tree pyramidal. Crop the first year, three large Apples.

1872 crop	12 peck	1879 crop	6 peck
1874	2 pecks	1880 "	5 "
1875 "	4 "	1881 "	4 "
1876 "	6 "	1882 "	5 "
1877 "	7 "	1883 "	5 "
1878 "	2 or 3 Apples	In 10 years	40 1/2 "

These were sold in Chelmsford at an average price of 1s. 6d. per peck. The tree occupies a space not exceeding 4 square yards, or at the rate of 1210 trees per acre. This is a result which, I think, will compare favourably with any foreign country. Another writer in the same issue, Mr. E. BARRMAN, said on the subject of bees and orchards:—"My own idea is that we ought to produce early Apples

grown on 'feathered bushes,' as they are sometimes called in Kent. These bushes should be on the broad-leaved Paradise stock, to dwarf the trees and bring them into early bearing. Amid these bushes, at no great intervals, hives of bees should be placed so that the blossoms should be properly fertilised. No fact is more clearly established than the fact that the annual crop of Apples depends in a very great degree upon the bees. If the weather be wet, and the bees are not close at hand to fertilise the blossom, there will be no crop. Mr. DANCK, of Gosfield Hall Gardens, Essex, one of the best gardeners in Essex, keeps hives of bees dispersed through every part of his gardens. His returns from sales in London are astonishing. I, too, have found my fruit sell so well that I am planting largely; but I cannot do without the bees. They fertilise my blossoms and produce me honey. Honey, too, is becoming more and more valuable. No food is equal to it. It is so scarce now that it can scarcely be purchased. A clerical friend of mine has received more than £100 for his honey this year."

HYBRID CARICAS.—The hybrid Caricas raised by Mr. VAN VOLXEM have now fruited in various places. It was anticipated that one of them might prove hardy in South-west Ireland, but we learn from Mr. GEMBLETON, to whom we sent seeds for trial, that this has not proved to be the case.

EPHING FOREST.—Epping Forest is popularly supposed to have now become absolutely the property of the public; but SIR THOMAS FOWELL BUNTON tells us that there are 719 commoners who have a right to feed cattle there, besides 211 persons on its borders who turn out their cattle without any right at all. Somebody or other, moreover, with or without right, is exercising the privilege of digging gravel within the Forest boundaries, and, what is worse, exercising it so recklessly that masses of rough clay are left on the grass, and trees are so undermined that they fall to the ground. It seems strange (observes a daily contemporary), that the verderers cannot put a stop to these practices. As to the cattle, we are told that only eighty-six out of the 719 commoners practically use their right. On the other hand, the interlopers number no fewer than 211. SIR THOMAS FOWELL BUNTON mildly expresses, on the part of the verderers, a desire that those who have no right to make use of the Forest in this way will "not use too freely that which does not belong to them." It would be more satisfactory to learn that some equitable mode has been found of extinguishing rights which do not appear to be much valued, and of bringing those who have no rights at all to understand that the Forest is not theirs.

FORCED NARCISSESS.—At a meeting of the Birmingham Gardeners' Association on the 4th inst., Messrs. HEWITT & Co. contributed some pots of *Narcissus maximus*, General Gordon, and Henry Irving, and showed plainly what beautiful objects they are at this early period of the year especially, and are so easily got into bloom. *Maximus* is a very fine variety for this purpose, and Horsfieldii and others are also available.

SALSOLACEÆ.—The unwearied Baron von MUELLER has commenced the publication of a series of illustrations of the Australian Salsolaceæ. They are not remarkable for beauty, but are of much importance as furnishing food for herds and flocks in the dry "salt bush" country.

ROSE HEDGES.—About ten years ago, says *Garden and Forest*, the Austro-Hungarian government planted the sides of a very exposed stretch of railroad, nearly a mile and a half in length, with hedges of the Provence Rose. The hedges have since reached a height of about six and a half feet, and a breath of half as much, for it is a peculiarity of the Provence Rose to interlock its branches and twigs. A living wall has thus been formed which effectively

protects the tract from snow-drifts, while a neighbouring stretch, where the Rose could not be planted, is so deeply buried at every snow fall that it costs much labour to clear it. The first cost was very small, and it is believed the hedges will live for thirty or forty years.

CHRYSANTHEMUM EXHIBITION AT GHENT.—We have received the programme of the exhibition to be held in Ghent, under the auspices of the Société Royale d'Agriculture et de Botanique, from November 16—19 next ensuing. Foreigners are invited to compete. The schedule contains fifty-two classes, besides several for miscellaneous exhibits of a decorative character. M. A. L. ROSEEL, Ghent, is the Secretary.

EXCHANGE IN GARDENERS.—It will be admitted that much of the good influence of the natives of these islands in all parts of the globe has been due to traits and characteristics which have been secured to them in great measure by their isolation from the rest of Europe by geographical position; but there are as usual corresponding disadvantages, which would by means of fuller intercourse with our near neighbours on the Continent in a measure disappear, and to few would this desirable consummation be so acceptable as the private and commercial gardeners of this country. The following letter from the Société Française d'Horticulture de Londres, whose office is at 27, Gerrard Street, Shaftesbury Avenue, points the way in which this mutual benefit may be conferred on those who desire it. "A society of French gardeners in England was some time ago formed, with the object of establishing cordial relations between the gardeners in France and their English confreres. The results obtained up to the present are highly satisfactory, for young men have already been placed in both countries. Believing that many English gardeners are desirous of sending their sons to the Continent to learn the different modes of culture, &c., practised there, while we know that many French nurserymen and gardeners are equally anxious to send their sons to England, we decided in our last meeting to proceed by way of exchange. The society would thus undertake to place in France an English young man provided that some one would take in exchange a young Frenchman."

SCOTTISH HORTICULTURAL ASSOCIATION.—This Society held its ordinary monthly meeting on the 14th inst., in 5, St. Andrew Square, Edinburgh, Mr. D. P. LAIRD, Vice-President in the chair. The business before the meeting was chiefly the consideration of the schedule for the Chrysanthemum Show to be held on Thursday, Friday, and Saturday, the 20th, 21st, and 22nd November next, in the Waverley Market, Edinburgh. "Proof" copies of the schedule which had been prepared by the show committee were on the table, and Mr. McKENZIE, Treasurer, pointed out the leading features of the projected competition to the meeting. The total amount in prizes offered is about £300, but this it is expected will be increased by extra prizes which will be embodied in the final schedule, which will be issued a few weeks hence. Meantime, intending competitors may have the "proof" copy forwarded to them on applying to the Secretary, Mr. ROBERTSON MEXICO, 6, South St. Andrew Street, Edinburgh. The schedule is got up on most liberal lines, as may be judged of by the following:—For "The Edinburgh Prize," forty-eight blooms Japanese, £40 in five prizes is offered, the first being £20, the fifth £2. The winner of the "Scottish Challenge Cup" will this year receive £5 in cash along with the honour, and less fortunate competitors in this class will also be substantially rewarded, as there are three good prizes besides the first prize. Twenty pounds in four prizes are offered for the best right bunches of Grapes, and £10 are offered for the best collection of vegetables, consisting of thirteen varieties. These are several of the leading prizes, but throughout the schedule is marked by the same liberality in every

class. The only exhibit on the table was a bunch of blooms of seedling *Helleborus niger* which were tabled by Mr. YOUNG, teacher, Fettes Row, Edinburgh, who has for some years been endeavouring to improve the Christmas Rose by intercrossing the more marked varieties. The flowers exhibited were said to be from the progeny of a cross between H. n. major and H. n. angustifolius. They were very fine, but hardly distinguishable from perfect blooms of either of the alleged parents.

INTERNATIONAL HORTICULTURAL EXHIBITION AT BERLIN, APRIL 25 TO MAY 5, 1890.—We have received from Professor DR. WITTMANN, general secretary of the Horticultural Society of Berlin, the following announcement, that the opening day of this exhibition is rapidly approaching, and the preparations for it are progressing satisfactorily. His Imperial Majesty the Emperor, on the recommendation of His Excellency HEINRICH FRIEDRICH, Dr. LUDWIG VON BALTHASSEN, Minister for Agriculture, Forests, &c., and Honorary President of the Exhibition, will give the Large Golden State Medal for horticultural productions to the contribution which shall be considered the most excellent. The Minister, in view of the great extent of the exhibition, has moreover sanctioned the awarding of eighty State Medals. All the State as well as several of the private railways of Germany, promise to afford free transit to all goods not sold at the exhibition. The Farmers' Club of Berlin, besides other associations previously announced, will give a Prize of Honour of the value of 100 marks. Architects and gardeners are alike striving to make the exhibition as magnificent as possible, and one decorative group, which will occupy 300 square metres, is already announced. Programmes may be obtained on application to the General Secretariat, Invaliden-Strasse 12, Berlin. The latest date on which announcements to exhibit can be received is March 1. In conjunction with the exhibition there will be a Congress held of German lovers of lawns, and announcements to compete in this section must be sent to HEINRICH STRASSMANN, in Sachsenhausen, Frankfurt-on-Maine. In connection with this exhibition, already referred to, illustrations of the geography of plants under the superintendence of Professor ANIMSON, will be displayed, and other branches will be represented as follows:—Physiology, Dr. FRANK; Seeds, Assistant Professor HEINRICH; Morphology and Development, Dr. KUN; Fungi, Dr. MAYER; Soils, Dr. OELM; History and Literature of Gardening and Botany, Dr. SCHUMANN; Official and Technical subjects, Dr. ISCHNER. Dr. WITTMANN informs us of the intention of the eminent firm of MM. VILMOREN-ANDRIEN & Co., Paris, to take part in the exhibition; also Mr. BEAUX, gardener to the Duke of SCOTLAND, Trentham; and F. SANDER & Co. St. Albans. The examination of all packages liable to surveillance under the Phylloxera laws in force at Berlin, will take place within the show buildings—a concession due to the efforts of Prince BISMARCK.

L. ORCHIDEENE. The last meeting was held on February 9, and was remarkable for the fine display of Cattleya Trianae, Cypripedium, and Odontoglossum. The following awards were made:—

First Class Diploma of Honour to Cypripedium Warocqueanum, from M. G. Warocqué; *Dendrobium glumaceum* var. *validum*, from M. E. Wallaert; *Laelia anceps* var. *Lindeni*, from M. J. Hye-Leyson. Certificates of Merit, First Class, to Odontoglossum Pescatorei var. *Lindeni*, from M. G. Warocqué; *O. Rossi* var. *maximum*, from M. Linden; *O. Wilckeanum* var. *albium*, from M. J. Hye-Leyson; *Dendrobium Wardianum* var. *giganteum*, from M. Linden; Cattleya Trianae var. *hyana*, from M. Linden; Cypripedium Godseanum, from M. Vervaeck; *C. villosum* var. *albo-marginatum*, from M. E. Wallaert; Odontoglossum crispum var. *luttatum*, from M. J. Hye-Leyson; Cattleya Trianae var. *Baillonville*, from M. G. Miteau; *C. Trianae* var. from L. E. Wallaert; *C. Trianae* var., from M. J. Hye-Leyson; *C. Trianae* var. from M. Vervaeck.

Certificate of Merit, Second Class, to Odontoglossum

sulphureum, from M. G. Warocqué; *O. mullis*, from M. J. Hye-Leyson; *O. crispum* var., from M. Linden; Cypripedium Bartletti, from M. Vervaeck; *C. barbato*; *Vetehii*, from M. G. Miteau; *C. hevigatum* var. *platytennum*, from M. Hye-Leyson; Cattleya Trianae var. *palida*, from M. Linden; *C. Trianae* var., from M. Vervaeck; *Cologne Lemoineana*, from M. G. Warocqué.

Cultural Certificate, First Class, to *Laelia anceps*, from M. G. Warocqué.

Cultural Certificate, Second Class, to Cypripedium Buxbii, from M. G. Miteau; *Maxillaria luteo-alba*, from M. Linden.

BIOGEOGRAPHICAL INDEX OF BRITISH AND IRISH BOTANISTS.—By JAMES BRITTON, F.L.S., and G. S. BOYLE, F.L.S., extracted from the *Journal of Botany*.—

MARTYN, ROY, THOMAS (1797?—1823): b. Chelsea 1797?; d. Pottenhall, Cambridge, 3rd June, 1825. Son of preceding. B.A., Camb., 1796. M.A., 1799. B.D., 1793. F.R.S., 1796. F.L.S., 1788. Prof. Bot., Cambridge, 1792. *Planta Cantab.*, 1763. *Catal. Hort. Cantab.*, 1771. *Flora Rustica*, 1792—94. Cimator*, 1823—1846. *Hortus Duroverni*, ed. 3, 1831. Hybridised Passion-flowers, *Albos. Actei*, &c. Had garden arranged on Natural System. *Gard. Chron.*, 1871, ii, 437. Bust by Weekes in Canterbury Museum.

PRIMULA SINENSIS. Some very pretty flowers of the above plant in various colours have reached us from Messrs. J. H. Veitch & Sons, Chelsea, the flowers of good form, and colours mostly very decided, and of considerable range. A few were what might be called semi-double varieties, the colours being rose-pink and red.

MR. GEORGE W. YOUNG.—This name will be recognised as that of a recently elected pensioner on the Gardeners' Royal Benevolent Institution—a pension he has not lived to receive. He was a most earnest, competent, and industrious gardener, as expert in growing specimen Heaths and hard-wooded plants as in producing high-class Grapes and vegetables. Mr. Young was for several years gardener to the late Viscount BARRINGTON at Beckett House, Berks, and subsequently became gardener to the late Duke of Buckingham at Stowe. While at Beckett he perhaps grew the fickle but beautiful *Lisianthus Russellianus* better than it has been seen elsewhere, some of his specimens bearing from 500 to 700 handsome blooms. After leaving Stowe he went into business, but lost rather than gained by the change, and eventually returned to work in nurseries and gardens. *Journal of Horticulture*.

PENTSTEMON MENZIESII VAR. SCOULERI. (Fig. 33.)

THE above charming North American plant comes from the Cascade Mountain range of the North-west, above Lytton, and is a woody, evergreen perennial, with large purple-violet flowers, which appear in the manner common to most of the Pentstemons. The plant, coming from an altitude of 5000 feet, is well calculated to withstand the utmost cold experienced in this country. Although in like manner to many other alpinas, which at home are covered with snow during the winter season, and suffer during our much milder winters if uncovered, this plant will be much safer if it be afforded a mulch of leaf-mould, fine coal-ashes, &c., at the approach of winter. We are indebted to the kindness of Dr. Dieck, of Zoeschen, Germany, for being enabled to figure the plant—the plant being amongst the novelties on sale at that nursery.

FLORISTS' FLOWERS.

CINERARIAS.

THE improvements effected in Cinerarias is little short of marvellous, the flowers having increased in diameter to 3 inches, whereas it was usual to have them only half that size, and the habit of the plants is much better than it used to be. The heads of bloom, although large, are not coarse, and the petals broad and well-defined, and of great substance, and of beautiful marking, and the sets are of rich and varied colours. Not only had this advance been made in the single-flowered varieties, but the double-flowered varieties have improved. These are doubtful gains to the gardener, although they may be useful for bouquets, and to make variety, and last much longer in the cut state. To perpetuate these, and any single-flowered variety which shows merit, take care of the plants after they have flowered, and encourage them to make side-shoots, which may be done by turning them out of their pots, and planting them pretty close together in leaf-soil, and sufficiently deep to just cover the ball. This will cause them to make fresh root and growth, and as the suckers throw up, they strike into the leaf-mould, and may then be taken off ready rooted and potted. To slip them off from the crowns without injury is better done with a knife, giving a downward cut, and raising the lower end. After a sufficient number of suckers have been taken, the whole root may be taken up, and the side-shoots pulled off, and repotted at once in small pots, and stood in a pit or frame kept close for a week, and where they can have a little warmth, and plenty of atmospheric moisture. Where it is wished to save plants for seed, the stock should be gone over as soon as they come into bloom, and the best selected, and placed apart from the others while the flowers are setting; and as the pollen is carried from one to the other by the air, and insects or bees, it is as well to net the plants over. Most of the nurserymen have fine strains of Cinerarias, some of them being specially noted for their superior breeds, and seed can be obtained from them at a reasonable rate.

The time for sowing depends entirely on the season the plants are wanted in bloom, but as they are generally liked early, the first sowing may be made this month, a second towards the end of March, and the third, and final, a month later, which will keep up a succession till late in the spring. In filling a seed-pan, let it be well drained, and finely sifted leaf-mould and loam, in equal proportions, adding a sprinkling of sand to it, and press it down firmly and evenly. Then water the soil with a fine-roset pot, and after the pan has stood a short time, the seed may be scattered thinly, and a slight portion of silver sand sifted over it. If the pan is then covered with a sheet of glass, and stood in a warm house or frame, the seed will soon germinate,

when the glass should be tilted for a day or two, and then removed, the best situations for the plants afterwards being a light shelf in an intermediate stove. When they have been pricked off into pans or boxes, put them into a frame which has gentle heat from fermenting material, or failing that, any pit or light house where there is artificial warmth and moisture. An ordinary garden frame stood in a partially shaded situation on a coal-ash bottom, with its back to the sun, will be the best place for growing them in the summer months. The plants should be frequently sprinkled and afforded full ventilation. The night dews are very beneficial, and when the weather is favourable, the lights may be taken off the frame at night and at others be tilted,

THE HARDY FRUIT GARDEN.

BORDERS FOR WALL FRUIT TREES.—It cannot be too strongly impressed on the minds of those who crop their fruit borders heavily with vegetables, that the fruit trees sustain great loss. It is not uncommon to see permanent plants growing almost at the foot of the fruit walls, and the heavy dressings of manure afforded the soil to grow good vegetables causes the trees to throw out strong wood, and at the expense of their fertility.

The Mulberry, although grown in most gardens, is not as a rule pruned and cared for, but is left to grow as it will, but these trees should have their chief branches thinned out, and other smaller ones spurred

FIG. 33.—PENTSTEMON MENZIESII VAR. SCOULERI: COLOUR OF THE FLOWERS PURPLE-VIOLET.

remembering that a close atmosphere in the frame will cause mildew. To prevent any check during the plant's growth, it is necessary to replot the plants before they get potbound; 7 or 8-inch pots are quite large enough for the strongest, and 6-inch for the rest. The soil most suitable for Cinerarias is fibry loam, leaf-mould, and a little mild, very rotten manure, in which mixture they should be potted firmly, and immediately well watered to settle the whole. As the plants are very subject to green-fly, it is necessary to keep a close watch on them, and to fumigate now and then, even if no insects are seen; but it must be done with care, as they will not stand much smoke, and a safe way is to give them a whiff at night and again in the morning. Cinerarias are also sensitive to frost, and though a low temperature suits them best, they quickly show the effects of the glass running below 32°; but anywhere a few degrees higher than that and 45° is safe for the winter. J. S.

in. Under this mode of treatment it is surprising what a large quantity of fruit a standard tree will produce, and the size of the fruit at the same time is improved, so that it becomes a useful dessert fruit, and one whose flavour many persons enjoy. The Mulberry is an ornamental tree of some value in the pleasure grounds, when it is grown in the kitchen garden or orchard; turf should be laid beneath it, and kept closely mown about the time the fruit is ripe.

Quinces and Mellars should be pruned and mulched; these often neglected trees will repay any extra attention. Strawberries should be heavily mulched between the rows, and lightly over the plants; and on no account dug between the rows, but weeds cleared off with a hoe and rake, and very lightly point the ground, giving a good sprinkling of soot, then follow with the mulching. Where the planting of new Strawberry beds could not be done in the autumn, the ground should be got in readiness now, by trenching it as deeply as it is advisable to do so, supplying at the same time plenty of manure, most

of which should lay about 1 foot from the surface; if the surface consists of old garden soil, with some good yellow loam below, it will be desirable to turn some of the latter nearer to the surface, which will tend to prevent the plants from growing too much to leaf, instead of forming flower-stems. *A. Evans, Lythe Hill, Hantsmore.*

THE ORCHID HOUSES.

EAST INDIAN HOUSE.—The need for shading this house was demonstrated early in the month by the sun shining brilliantly out, and country growers who were caught napping would be caused some inconvenience directly, as Phalenopsis dislikes strong sun shining directly upon them at any season of the year. With the increase of warmth and light, moisture in the house may be slightly increased, but this must be done with caution, as cloudy weather is almost certain to return shortly. *Saccolabium bellinum*, now coming into flower, is a curious and pretty Orchid, which does very well in this house, should be hung up as close as can be done with safety to the top ventilators, and never made too wet, or the tips of the leaves will certainly "spot."

Calanthe Masuca and *C. veratrifolia* are now growing strongly, and where the plants have filled the pots with roots, weak liquid manure may be afforded them with advantage, and if made of guano it may be applied with safety at the rate of 1 oz. to 1 gal. of water-soot may be applied to the surface of the soil before watering. I do not advise this to be given at every watering, but alternately with clear water. A little tobacco smoke may now be applied to the plants in the different departments. Tobacco-smoke is certainly very injurious to some plants, while others do not seem to be the least affected by it. For, say, a house 30 feet long, it should have just sufficient smoke given that the end opposite to that at which the operator stands is not quite obscured. Under this condition I have never known any plant to be injured by it, if the foliage was comparatively dry when the fumigation was done. Fumigation is most inimical to thrips and yellow aphids. Saturday being usually the day when watering is done, the plants are the driest on Friday night, and that is when we do our fumigation. Temperature of this house the same as advised for last week.

Cattleya House.—With the advent of February, we are reminded to push on with *Cattleyas* and *Laelias* which require to be repotted, and the advancing season will bring daily accession in airing, shading, &c., and less time will, therefore, be found for doing that later on, which should have been done now. I should like to say that I believe it to be bad policy to let any plant stop in the same pot for more than two years, so it will readily appear how important it is that the work of repotting should not be delayed. To the list of plants given in last week's calendar I may add *Cattleya Gaskelliana* and *C. Mendifii*, if late flowering; also *Laelia autumnalis*, *L. albida*, *L. Guildiana*, &c. Temperature the same as given in our last.

Intermediate-house.—This house is now gay with *Cyclogyne*; every amateur who has an Orchid-house or warm greenhouse has not got the right plants if *Cyclogynes* are not included, and they are within the reach of everyone. The pure white variety, which is still rare, and is later flowering than the type, must not have too much water now, or the spikes will damp off. *Cymbidium Lowianum* now throwing up spikes will be assisted if guano-water be afforded in the same manner as advised for the evergreen *Calanthes*. *Pleiones* which are now growing fast, will be assisted by overhead syringing every fine morning, and which will keep the plants free from red-spider—a pest to which they are rather addicted when kept dry. *Oncidium sarcodes* now coming to flower must not be allowed to become dry at the root, this being a plant that suffers more or less from flowering, according to the size of spike. I do not like the plan of tying the spikes around three sticks, the flowers do not then show themselves to the greatest advantage. I like to have them hung close to the roof, the flowers then all hang down, and present a much better appearance.

Dendrochilum glaucum, now pushing up growths and spikes, must be well supplied with water. This species does much better when grown in this house, as do also its congeners, *D. filiforme* and *longitula*. *Cattleyas* *Payana*, *marginata*, and *Laelia prestantis*, should be kept moist, and be also afforded not much potting material about their roots; and the plants

may be examined to see that nothing is decaying, either baskets, blocks, or rafts, and the little peat and sphagnum should be fresh, or they will soon lose their roots. These are perhaps the most useful plants we have for autumn flowering. Temperature, 55° at night, 60° by day.

Cool-house.—Disas will now be growing fast, and may with advantage be syringed overhead on fine mornings. These plants like light and air, and I grow them on the top of the stage of a lean-to house, facing north, and close to the ventilators, a place that seems to suit them admirably, as they grow like Leeks, and the leaves keep of a deep dark green colour. Peat and sphagnum moss are the materials required to grow them well, and I have tried them in loam, peat, leaf-soil, &c., but find that the best results came from the use of peat and sphagnum. Temperature, 45° to 50°. *A. G. Cutt, Parkfield, Worcester.*

FRUIT REGISTER.

APPLE MANNINGTON'S PEARMAIN.

This splendid Apple (fig. 34) is a chance seedling, which originated in a blacksmith's garden in Kent about one hundred years ago. We grow over a hundred varieties of Apples here, but I consider this the best

FIG. 34.—MANNINGTON'S PEARMAIN.

of them all, for let any one visit the fruit-room in October or November, and the shelves will be found in a good season to be loaded from end to end with scores of kinds; but it is after Christmas that the test comes, and one then sees the best keepers and most valuable varieties. The variety in question is a compact grower and bearer, and of delicious flavour, and should never be used until after the new year. Nearly all our late-keeping Apples are gathered too soon—*Sturmer Pippin*, *Cockle Pippin*, *Golden Harvey*, *Golden Knob*, and this variety should be left on the trees till quite late, and their keeping qualities and flavour will be improved thereby. I am out of all patience with the constant praising up of foreign Apples, and rating down our own. Why, one of our cottagers here paid half his rent last year with the crop of two trees of the *Wadhurst Pippin*; and one old Apple tree on one of the farms hereabout bore in one season the incredible quantity of sixty bushels. I took a turn round Covent Garden in December, and by request bought for a gentleman a barrel for £1 3s. of "Greenings," a Canadian kind, but when opened found that nearly half were unuseable. I have seen the same thing over and over again with barrels of *New Town Pippins*; and when I say that there is plenty of land in this county at £1 per acre, which will make good orchards, there is great shortsightedness somewhere—paying good English money away for what we can grow at home. A few healthy articles have appeared in the *Times* lately, and in

addition to what most writers say, I would strongly recommend dwarf trees, abundant shelter, and plenty of bees to fertilise the blossoms.

Last year was a bad year for Apples, yet we had full crops of *Wadhurst Pippin*, *Northern Greening*, *Hawthornden*, *Duchess of Oldenburgh*, *Stirling Castle*, *Col. Vaughan*, *Codlin*, *White Paradise*, *King of the Pippins*, *Orange Pippin*, *Bess Pool*, *Old Nonsuch*, *New Hawthornden*, *Evagil*, *Winter Nonsuch*, *Betty Geeson*, *Tower of Glamis*, *Hoary Morning*, *Easter Pippin*, *Ringmer*, *Golden Knob*, *Rosemary Russet*, *Sturmer Pippin*, and *Mannington's Pearmain*—two dozen in all. *Joseph Brist, Erridge Castle, Sussex.* [In Kent or Sussex this may be possible, but are reminded that all England has not a Kentish soil and Sussex climate. Ed.]

APPLE GOLDEN KNOB.

The above Apple is a very useful one for the dessert, in use at the present time. The fruit are not large, but are uncommonly crisp in texture of flesh, and sweet. The tree generally crops heavily, and is a strong grower. I may say the colour of the fruit is almost entirely covered with russet, and being easily distinguished from most other varieties. *H. Markham.*

HOME CORRESPONDENCE.

DAFFODILS "NECK AND NECK" TO BLOOM AT ARD-CAIRN, CORK.—I send out specimens of the following early-flowering Daffodils now in flower out-of-doors at Ard-Cairn, Cork, viz., *Ard-Righ*, or *Yellow King*, *North Star* (very early), *Pallidus Præcox*, and *Bicolor Præcox*; the latter comes from the *Lyreones*, *H. B. Hortland*. [Excellent blooms of all the above-mentioned varieties came with this note, bearing out our correspondent's statement. Ed.]

FIRST-BLAST, OR FIRE BLIGHT, IN FRUIT TREES.—In our country we have a very destructive disease of the Pear known as "Fire-blight." Huge branches—often the whole tree—will die, apparently in a few hours. The leaves do not turn brown, but usually black, and emit an odour of putrescence. Usually an inch or so of the bark at the base of the injured part is brown, and the line of demarcation between this brown and black bark can be distinctly seen. In the blackened part our mycologists find a new species of Bacterium, which they have styled *B. amylovorus*, and many regard it as the cause, by their rapid development of the tree's death. Something similar occurs in the Apple, but usually affects its twigs, rarely its main branches, as in the Pears. I have never been able to trace this disease to Europe, though I have read of something similar, though rare, in the Pear trees of France. Happening to turn to *London's Gardeners' Magazine*, vol. iii. 1827, p. 280, Mr. Robert Sutherland, gardener at Golden Park, Hert's, writing of the diseases of fruit trees, mentions "Fire-blast," which sometimes destroys the whole tree in a few hours." He does not say in what kind of fruit tree. It sounds so much like our "Fire-blight," that it is probably the same, or similar. I never heard before of this disease in England. It will be interesting to know whether it still exists, and what is known about it. Those who are studying "Fire-blight" in this country would be much assisted by a knowledge of its geographical range. *Thomas Meher, Germantown, Philadelphia.*

VANDAS.—My experience in the cultivation of *Vandas* in respect to shading here in West Middlesex coincides with that of Mr. Douglas (p. 132, Feb. 1), one instance I will give is a case in point. The plant was a fine variety of *V. tricolor*, which had grown from quite a small plant; the plant from which it had been taken used to flower freely, but I could not induce the younger one to do so until it had been in my possession for some time. This was not because it was not large enough to flower, nor through ill-health either. I grew the plant for a few years in a house that was shaded heavily for Ferns and other tender subjects, and was rewarded with one, or at the most two, spikes each season. This not being satisfactory, I removed it to another stove of about the same temperature; and here,

with a lighter shading (Britain's Netting, No. 3) and more exposure to the light when not shaded artificially, the plant flowered at nearly every joint. It produced, season after season, nine and ten spikes in constant succession. Getting too tall at last, it had to be lowered, which caused a check, but it now bids fair to continue its free-flowering this season, it being in the best of health, and having twenty pairs of leaves upon the single stem, which clothe it to the soil. Here I would like to confirm what Mr. Thomson mentions (p. 174, Feb. 8) respecting the overhauling of Vandas about September. I cut mine down during that month in last year with the best results, not even losing one leaf either at the time or since. On a previous occasion I cut it down in the spring, but in spite of every precaution I lost several. My plant was potted nearly in the way Mr. Thomson advises: peat, charcoal, sphagnum moss and crocks being mixed together, and put two-thirds of the way down the pot. I firmly believe it is far better to endeavour to induce all of the roots to enter the soil, rather than allow them to ramble outside of the pot with greater risk of injury to their points. In the pot they will throw out large bunches of rootlets from each main root, and which must be a great assistance to the plants, especially when sustaining several spikes in operation. *J. H.*

PRIMULA AMÆNA.—It is very much to be hoped that this plant is not lost to cultivation. I somehow do not think that it is. Some amateurs in this locality possess many very choice hardy plants, and if I am not mistaken, I think *P. amœna* may be found. There is one I know of which is very like the description given by Mr. Wolley Dod, but I will not venture to say that it is the plant in question; but when the flowers appear, I will forward you a few. [Please do so, Ed.] While writing on Primulas I would like to call attention to the usefulness of *Primula verticillata*, or, as it is more commonly called, the Abyssinian Cowslip. It flowers in the fashion of the common Cowslip, but the foliage is quite white with a covering of what might be taken for millers' dust. It flowers in April, and has a pretty shade of yellow. The best way to grow it is to plant it out in a sheltered place in the summer, and lift; replot it in the autumn, and keeping it in a cold frame till about the month of March, when it may be put into a warm greenhouse, where it will flower well. *P. floribunda*, too, is a pretty little yellow Primula, and looks best when grown in a pan, with the middle plant raised a little, and the outside plants allowed to touch the outside of the pan. Well filled pans have a very pretty effect in the conservatory, and the plants are very easily raised from seed. *G. Merritt, The Nursery, Harpenden.*

HEAVY CLAY LAND.—The criticism of my note by W. L., on the treatment of heavy clay soil has not altered my opinion that autumn-trenched ground when left alone makes a better seed bed in spring than it does when again dug over. I have sometimes given the second digging to land more as a trial of the plan, but have always had reason to regret having done so. All heavy soils however are not alike in texture, but they vary considerably, and I write in accordance with the experience I have gained here with a soil the consistency of which may be gathered when I say a piece of ornamental water in the garden which covers the site from which clay was taken for the making of bricks when the mansion was in course of building, and the soil in the kitchen garden is of a similar nature. It would answer no purpose to repeat our mode of cultivation, which without exception affords a very satisfactory seed bed. But I would point out the dilemma we should undoubtedly be in were we to adopt your correspondent's practice. Deep stirring of the soil about the middle of February is recommended. What does that mean? During February, our soil and other heavy soils are in a more or less wet state, and to stir and tread them then would puddle and cake them, so that mischief would be done, which no after treatment could rectify. Satisfactory crops of early Peas, Turnips, Onions, &c., would consequently be out of the question, and upon this point my argument in favour of autumn and against spring trenching of heavy soils, rests. I hold that autumn-trenched clay ground, provided it is left alone, becomes in a fit condition for cropping earlier in the season than that which is trenched in the spring, or dug over after the trenching in late winter, all the benefits of exposure of the soil to frost being thereby lost. The same argument applies to Onions succeeding Celery. It is impossible to have ordinary clay soil

which has been trodden and moved through the winter in all weathers, as the Celery ground must be in good tilth for the Onion crop. W. L.'s clay is evidently of a very favourable quality. I may mention that rain or snow fell here on 18 days in February last year, amounting to 3.53 in., and at no time during that month did we have more than two consecutive dry days, and this may be taken as a fair average of our weather in that month. The remark respecting the destruction of woodlice and weed seeds, by stirring the soil in February, needs no comment. Whoever before heard of woodlice infesting clay land at that season, or seeds of weeds being killed wholesale by bringing them near the surface of the soil at a time when warmth increases? *Thos. Coulcher.*

SEQUIOIA GIGANTEA.—In the pretty grounds attached to Whitechurch Rectory, Edgware, are several handsome specimens of this tree, with trunks at 2 feet from the ground, of 4 feet in circumference, and which are from 40 to 50 feet high, and perfectly straight, and furnished with luxuriant foliage from base to summit. There are several other choice and well-grown Conifers in these interesting grounds, but the Sequoias are the most noticeable. The soil is a stiff yellow loam. The Rose beds and shrubby borders are edged with thick rows of established Pæonies and Auriculas, which must have a telling effect when in bloom. The Rev. John B. Norman, rector of Whitechurch, is an enthusiastic horticulturalist, and has several houses devoted to orchid culture; three of them being, till quite recently, filled chiefly with *Odontoglossum Alexandrie*. Some years ago the reverend gentleman was better known in the Orchid world than he is at the present time, but so long as *Cattleya gigas* Normanii is retained in our collections, his name is not likely to be forgotten by the cultivators of Orchids. *H. W. B.*

GALANTHUS REDOUTEI, AND G. LATIFOLIUS.—Amongst a good deal of confusion which is being caused by an unauthorised multiplication of the names of Snowdrops, one mistake seems to be general with regard to the names *G. Redoutei* and *G. latifolius*. *G. Redoutei* of Regel (*Prodr. pflanzl.*, 1874, p. 292) differs from *G. nivalis* in the breadth of the leaves, and in being larger, and has also been called *G. nivalis var. latifolius*. It is a Trans-Caucasian plant, and has been referred to *G. plicatus*, from which it differs only in having no folds in the leaves (see Boissier, *Fl. Or.*, vol. v., p. 145). I have the same variety from some source, named *G. plicatus var. caucasicus*, but to refer the variety to *plicatus*, when it has no folds, seems a misnomer. Perhaps this is now to be called *G. caucasicus*, Baker, which is described in Ware's Bulb Catalogue of 1889 as "new," but it has been in cultivation in England at least ten years, and only the name is new. *G. latifolius*, Ruprecht, described in Boissier's *Fl. Orient.*, vol. v., p. 146, is generally sold by the name of *G. Redoutei*, to which it has no claim. Its broad, shining leaves make it entirely distinct from all other Snowdrops, and more resemble those of a small *Colchicum*. Messrs. Damman, of Naples, when I asked for *G. Redoutei*, rightly sent me *G. nivalis* var. *Redoutei*, of Regel; but perhaps the name *Redoutei* ought now to disappear from catalogues, being replaced by *caucasicus*. *C. Wolley Dod, Edge Hall, Malpas.*

SUTTON'S PRIMULA SINENSIS DOUBLE SCARLET.—Not only do the semi-double strain of Primulas which Messrs. Sutton & Son made such a display with at the Royal Horticultural Society meeting some time since, come true from seeds, but in many cases the seedlings show marked improvement on former strains. Among double scarlets of their strain grown by Mr. Russell, gardener to Edward Moon, Esq., at Cassiobridge, are some vividly coloured scarlets of a dark hue, which should be perpetuated. In the same gardens the old double white is well grown, and is still considered to be the best white Primula to grow for cut flowers. For the same purpose, however, Sutton's semi-doubles are much liked, as they do not drop the flowers as do the singles. *J. O'B.*

STRAWBERRIES MOWN OVER.—We all believe, or persuade ourselves that we believe, that "an ounce of practice is worth a ton of theory;" and this *apropos* of mowing off in the early winter the leaves of Strawberry plants, I will premise that my father was a gardener, and a very good one he

used to be thought by his brethren of the craft, and he had charge of a big place where much was required in fruit and vegetables at nearly all times of the year; and certainly it would never have done for the supply of Strawberries for the still room or the dessert to run short. Well, in spite of knowing this, and the dire effects to himself should such an untoward event arise, he invariably gave orders to mow over "Black Prince," "Scarlet," "Jobboys," (Hantboys) and by year, and as an enrichment of the land and a covering to their naked crowns, a coating of leaf-mould well-decayed, and mixed with the remains of exhausted Mushrooms, was afforded them. As to the quantities of fruit picked in proper season, let the remembrance of honest backaches acquired in the long pickings attest. Varieties there were which were not so much cut into the quick, and these are such as have heavy foliage, which keeps green for a longer time than the earlier ripening varieties above alluded to. To this class belong Elton, Keen's Seedling, British Queen, Frogmore Late Pine, and Trollope's Victoria—varieties not thought much of now, but which are bad to be beaten when well done. Gardeners stuck to their own practices as much then as now, and good crops were got by quite opposite methods, but only by those men who did not dig deeply close up to and between the plants. *A. Y. E.*

OUTDOOR STRAWBERRIES.—It is the practice with many in the management of outdoor Strawberries, to take the whole or greater part of the foliage off during winter, and not only that, but to dig amongst the plants, which, in my opinion, are the two greatest mistakes that can be perpetrated with regard to them, as removing the leaves exposes the crowns and hearts of the plants to all the vicissitudes and changes of weather, and the digging destroys the young surface-roots, and makes the ground loose, which conditions are adverse to the welfare of all Strawberries, as what they require is a firm bed and shelter for the fresh foliage that pushes up in the spring. Instead, therefore, of trimming them, it is far better to leave them for the present pretty much as they are, and in lieu of digging they should only have the ground cleaned by hoeing, or in some other way to free it from weeds, and when this is done, it will benefit the plants considerably to spread amongst them a good dressing of short manure, which will protect them against hard frost, and feed and nourish the roots, as the rains will carry the pieces down and enrich the soil as far as they go. Not only is a top-dressing of manure of great value towards securing good fruit, but in the case of old plants, soil mixed with it is of great use to mould up round them, as Strawberries get so far above the ground through the stems of the crowns elongating, and when these find fresh material around them, they quickly emit young roots into it, and thus add to their strength. *J. S.*

SAMBUCUS RACEMOSUS.—My experience of this plant is, that it fruits much more freely when the seeds are sown where it is to grow, than it ever does after being transplanted. Just now I can only remember one case of a transplanted tree fruiting even fairly well. It is by no means plain why this should be, for one would think that the contrary would be the case. When freely fruited, it is a handsome subject. Can any of your readers bear testimony to the value, or otherwise, of the yellow-fruited form, *S. r. fructo flavo*? *T. Smith, Newry.*

IRIS BORNMUELLERI.—Mr. Dewar will find the description of this new Iris in the *Flores*, 1889, p. 140, K, G.

THE LATE W. WILDSMITH.—It was stated in the obituary notice of the lamented W. Wildsmith in our last issue, that he was born at Bradford, but as a matter of fact he was a native of Luddenden, a village near Halifax, and he kept up his connection with the place to the last. *John Wormald, Luddenden.*

CHINESE SACRED LILY.—We send you for your inspection two plants of the Chinese Sacred Lily that we have grown, and think you will be interested in seeing them. We have noticed the following peculiarities. Bulbs grown in gravel and water flower some four days earlier than the bulbs grown in mould, in all other respects treated alike. Another peculiarity of this variety is that the offshoots are the first in all cases to flower before the main stem. Although this variety of Narcissus is indispensably

connected with forms already in existence, it appears to possess a distinctiveness, by reason of its floriferous habit, as well as by the delicacy of the odour of the flower, and the public, who have grown them, so far as the reports sent us are concerned, appear to be very pleased with the plants, as being specially adapted for drawing or living-room cultivation. *James Carter & Co.* [Well grown and flowered. Ed.]

THE GOOD-LUCK LILY.—I have now in full and beautiful bloom seven bulbs of the Sacred Lily of the Chinese (*Narcissus tazetta* Grand Emperor) in four Japanese bowls, and bearing no fewer than forty-five spikes of bloom; the perfume exhaled by them is somewhat overpowering. The first flower opened just six weeks after the bulbs were put into water, and nearly all the offsets or side bulbs have produced a spike of bloom. I wish some one would state in the *Gardeners' Chronicle* the treatment best suited for these bulbs after flowering. Should they be kept still supplied with water, or be gradually dried off, and will they be any good for next year's bloom? *H. E. G.*

BIRDS AND FLOWERS.—Birds dislike bitter tastes, and the best preventive I have found to protect Crocus flowers against sparrows and pheasants is to spray them with an infusion of Quassia chips. These make so strong a bitter that a quarter of a pound in several gallons of water is sufficient. The chips are very cheap, and they should be boiled to extract all their virtues. Those who think that the effect will soon be washed off by rain should try, as I have done—sprinkling a Gooseberry bush with the infusion soon after the fruit is set. The Gooseberries retain the bitter taste till they are nearly ripe. I think this treatment would prevent bulfinches eating buds. *C. Wolley D. J., Edge Hill, Malpas.*

EARLINESS OF VEGETATION IN THE SCILLY ISLANDS.—During the whole of the history of floriculture in these islands there was never the like seen so early in the spring, as at the present time. The mildness of the winter here caused the Narcissus crop to bloom quite a month earlier than usual, and consignments of flowers were sent off before Christmas, and in very large quantities since January came in, as much as from 10 to 15 tons twice a week having been despatched; and during last week one grower (Mr. F. Watts), sent off about 10,000 bunches or 120,000 blooms of Narcissi of different varieties. At the time I am writing acres of Solid Gold and Scilly White Narcissus are in bloom, not in small patches of a few rods, but an acre in extent, the quality as well as the quantity of the Narcissus crop generally was never excelled. There are now in bloom in the open air, Narcissi Solid Gold, N. Scilly White, N. Solid Gold Brilliant, N. Etoulo-Or, N. Paper White, N. gloriosus, N. Grand Monarque, N. Bachelman minor, N. Belle of N. ramapo, N. Talamoni plum, N. Double Incomparabilis, N. Golden Phoenix, N. Orange Phoenix, Single Incomparabilis, Trumpet Daffodils, N. obvallaris, N. pallidus praecox, N. Golden Spur, N. princeps, N. Achilles, Ard Rich, N. Countess of Annesley, and N. odorus. Campanelli and Anemone fulgens are in great abundance; Wallflowers and Richardias are also being sent off to market. *H. Tinsley, St. Mary's, Isle of Scilly.*

RICHARDIA ÆTHIOPICA.—I saw recently a fine display of these plants in a low span house at Blankney Hall, Lincoln. The plants were growing mostly in 12-inch pots, and had been flowering since the middle of December. With a view to flowering the plants at an early date they were grown in pots in a rich loamy soil, and well supplied with water whilst growing, with an occasional watering with liquid manure after the roots had filled the new soil, and still more frequently after the appearance of the spathe. This plant makes good returns for the generous treatment, spathe realizing about ten shillings per dozen in some of the large northern towns at the present time. *H. W. Ward.*

A REMEDY FOR THE BULB MITE.—Previous to about fifteen months since I had been very successful in the cultivation of *Amaryllis reticulata*, but suddenly the bulbs ceased to do well—no sooner did a leaf rise above the soil than it turned yellow and rotted away. I was much puzzled as to what could be the cause, and I tried several things, but all to no purpose. A friend of mine who had been much troubled with the Eucharis (bulb) mite informed me that the mite had also attacked his *Amaryllis*, and

that he had tried Clibran's mite killer with excellent effect. I then examined my bulbs of *Amaryllis* under a good lens and found them to be literally covered with insects identical in appearance with the mites that I had previously seen taken from Eucharis bulbs. I procured a tin of the mite killer from Messrs. Clibran, and used it according to the directions, except that I allowed the bulbs to remain in the mixture for about twelve hours. I then washed them clean, and allowed them to dry. I then potted them in equal parts of loam, peat, and Oak-leaf-mould. They are now in excellent condition, throwing up splendid leaves, and I have every confidence that in due time they will again flower well as of old, thanks to the mite killer. *H. Ellis, Bordon.*

GALANTHUS UMBRICUS.—Mr. Ware offered, last autumn, Snowdrops under this name, for which I cannot find any authority. I planted a few in September, and this winter, when all spring bulbs were so dangerously forward, one or two of this lot came into flower about New Year's Day, a little before *G. Imperati*, which is generally the earliest here. Now that the two are in full flower side by side, I have compared them, leaf and flower, and cannot see the least difference. Both are larger in all dimensions, and have the petals longer in proportion than the typical *G. nivalis*; I find the variety *G. Imperati*, which I have had from Italy, as well as from English dealers, far more constant in form than *G. Elwesii* is. *C. Wolley D. J., Edge Hill, Malpas.*

EARLINESS OF THE SNOWDROP.—I was interested on reading your correspondent's note on "The First Snowdrop," and thought it would be of interest to your readers to know that Snowdrops were gathered here this season on December 22; this date being the earliest on which has been recorded for the last thirty-seven years at this place. Last year, blooms were gathered on January 6. I may state that the Snowdrops alluded to grow on a bank on which Planes and Limes are growing, and receive no attention whatever. *D. S. M., Garswood, N.B.*

SOCIETIES.

ROYAL HORTICULTURAL.

FEB. 11.—At the meeting held last Tuesday in the Drill Hall, Westminster, there were but few exhibitors before the Fruit and Floral Committees; but on the other hand, Orchids, chiefly hybrid *Cypripediums*, were fairly numerous, notwithstanding the cold weather. A conspicuous exhibit was Messrs. Chas. Lee & Sons' interesting collection of evergreen shrubs, &c. The annual general meeting of the Society was held in the Oldios, 117, Victoria Street, in the afternoon. It was presided over by Sir Trevor Lawrence, Bart., M.P., and there was a good attendance of Fellows. The chief feature of this meeting was the propounding by Baron Schroder of a scheme for the erection of a Horticultural Hall as a permanent home for the Society. Other observations on this subject will be found on p. 200.

Floral Committee.

Present: W. Marshall, Esq., in the chair, and Messrs. R. Dean, T. Bates, C. T. Drury, H. B. May, P. Blair, W. C. Leach, R. B. Lowe, B. Wynne, H. Turner, G. Paul, G. Nicholson, F. Ross, W. Holmes, E. Mawley, T. W. Girdlestone, and W. H. Williams.

From Messrs. Chas. Lee & Son, Royal Vineyard Nursery, Hammersmith, W., there came a large collection of evergreen shrubs, arranged in ornamental groups in a regular and artistic plan. The plants employed comprised standard Ives and Laurustinus, Holly bushes in variety, heavily-berried Aucubas, *Dracenas*, *Osmanthus ilicifolius argenteus*, the variegated-leaved *Elaeagnus*, *Persea mucronata* in berry, *Eunonymus japonicus elegans*, and various other plants of the same character. The style of exhibition was novel and showy.

A collection of hardy plants in pots was shown by Messrs. Paul & Son, Old Nurseries, Chessington, N. The chief objects were various *Hellebores*, including *H. colchicus* var. *coccineus*, with rich red brown flowers; also a pan of *Eranthis hyemalis*, Saxifragas, &c.

Cut flowers of *Helleborus colchicus* and *guttatus*, in variety; early *Narcissus*, including *cyclamenifolius minimus*, and the yellow *Corbularia*, with *Poeticus ornatus* and *Anemone fulgens* and *strutia*, were shown in a pretty little group by Messrs. Barr & Son, 12, King Street, Covent Garden, W.C.

Other exhibits included a large single-flowered delicate pink *Frimula* from Messrs. H. Cannell & Sons, Swanley, Kent; and a large white-flowered plant, *Woodsie Giant*, from Mr. James, Farnham Royal.

Mr. F. Ross, Pendell Court Gardens, Bletchingley, sent a flower-head of *Dombeya Wallichii*, and also flowering branches of *Akebia quinata*, a useful greenhouse climber.

From Messrs. J. Veitch & Sons, Chelsea, came more novelties in the Javanico-multicolor section of *Rhododendrons*, *Eclatante*, with medium-sized flowers in a good tuss, deep red is an attractive addition, and so is *Admirable*, with broad spreading petals of rich salmon-red.

Mr. James Douglas, Great Gearies Gardens, Ilford, sent many seedling *Hellebores*, raised by him from a dark-flowered form of *H. guttatus*. They were mostly dark coppery-brown, with spots at the base of the segments, but one was white with spots, coloured as in the rest.

A group of *Cyclamen* in pots was sent by the St. George's Nursery Company, Hanwell, but call for no special mention.

Messrs. Bracher & Co., West Hill, Wincanton, exhibited "perforated metal flower-pots." These are made of perforated zinc, painted over. We do not see that any advantage will be found by their use.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. F. G. Tanta, F. Sander, T. Moore, L. Castle, J. Douglas, H. Williams, E. Hill, C. Flecher, W. B. Latham, J. Dohiny, H. Ballantine, H. M. Pollett, S. Coutdale, De B. Crawshaw, James O'Brien, and A. H. Stuede.

From the collection of H. M. Pollett, Esq., Fenside, Bickley (gr., Mr. Parks), there were sent a form of *Cattleya Trianae*, which had a bluish colouring on the median lobe of the lip; *Odontoglossum crispum* Bickleyanum, yellow with brown spots; *Cypripedium Elliottianum*, which appears to be identical with *C. Rothschildianum*, as figured in the current number of the *Botanical Magazine*, t. 7102. The dorsal sepal is oblong-acute, yellowish, with brown purple lines; the petals are linear, 5 inches long, similarly coloured, with spots at the basal part, and stout hairs along the margin; the lip, which is shaped as in *C. Stonei*, is brownish-red. A conspicuous feature is the peculiar-shaped staminode, which is compared to the head and neck of a crane. Also a plant of *Cypripedium Germianum*, a hybrid of *villosum* and *hirsutissimum*. The petals are 3 inches long, yellow-brown, with the upper end rosy, and yellowish towards the lower edge, dorsal sepal green, with brownish shade, and spots darker towards the base; the lip is that of *villosum*; the flower is hairy, as in the other parent.

Three *Cypripediums* were sent by F. G. Tanta, Esq., Shepherd's Bush (gr. Mr. J. C. Cowley). The most striking being *C. porphyrochlamys*, a hybrid from *C. barbatum*. It is rich brown crimson all over the flower; the dorsal sepal has a white edge and dark lines, and the petals, which become paler at the base are spotted with a dark colour and bear hairs along the margin; also *C. Mrs. Canham*, a large flowered hybrid, and *C. Lathamianum*, which plant was also shown by Mr. Bond, gr. to C. L. Ingram, Esq., Elstead House, Godalming; Mr. Ballantine, gr. to Baron Schroder, the Dell, Egham, and Messrs. J. Veitch & Sons, Chelsea, S.W. The parents are *C. Specianum* and *C. villosum*. The lip and petals are bright yellowish brown, and shiny. There is a central dark line down the petals sharply dividing the coloring, which is greenish on the lower half. The dorsal sepals large, white with a central nerve, greenish at the base with brown spots. The flower is very handsome and distinct.

From Messrs. Veitch, who had a very fine form of the above, there also came *C. Germianum*, and a spike of the pretty hybrid *Phalaenopsis*, T. L. Ames, *Dendrobium Wardianum japonicum* bearing small white flowers with a red brown blotch in the throat; also *Cypripedium Calypso*, which is practically the result of the reversed parentage of *C. Lathamianum* it is paler in colour throughout, and the dorsal sepal has more conspicuous and longer lines and dots of colour.

A very elegantly coloured form of *Lycaste Skinneri*

named Regina, was sent by Mr. J. Simon, gr. to E. A. Roberts, Esq., Woodland House, Greenbithe, Kent; it has pleasing rose-coloured sepals, shaded towards the base, the petals and lip being very dark; a pretty form of *Cymbidium eburneum* was also sent by this exhibitor.

From A. H. Smee, Esq., Wallington (gr. Mr. Cummins) there was a well-flowered plant of *Odontoglossum ramosissimum* var., with a number of flowers, white, spotted with purple-violet, the undulate margins of the sepals and petals giving a very pretty effect; *Cattleya Trianae* var. *Dayana*, light rose, with the median lobe of the lip brilliant intense carmine; also *Masdevallia leontoglossa*, with one flower with a singular shaped lip. In colour the flower has little to attract notice, being pale yellow-green with purple-black markings.

Cypripedium cardinale, Vanner's variety, was sent by Mr. W. Vanner, Camden Wood, Chislehurst. The lip was rich rose, and the sepals and petals delicately flushed with the same colour; also *Cattleya Trianae* var., including including C. T. alba, and one with a pale fringe to the lip, and dark tips to the other segments of the flower; also a plant of *Lycaste Skinnerii* alba, with a number of pure white flowers.

Other exhibits included a few nicely-grown examples from Mr. D. Callimore, gr. to S. Cook, Esq., a piece of *Cattleya amethystoglossa* being the chief object; there was also an example of *Odontoglossum Humeanum*.

From Mr. J. Quarntern, gr. to A. S. Smith, Esq., Silvermere, Cobham, Surrey, came a well-grown example of *Cypripedium insigne*, with eighty-seven flowers on it.

Celogyne cristata was sent by Mr. Waldham, Streatham Hill, Mr. O. Thomas, Chatsworth (the Chatsworth variety), and Mr. Miller, gr. to Lord Foley, Ruxley Lodge, Esher.

Fruit Committee.

Present: Sir C. W. Strickland, in the chair; and Messrs. J. Lee, P. Crowley, H. Weir, R. D. Blackmore, J. Cheal, P. Barr, W. Bates, W. Denning, S. Ford, J. Wright, G. Banyard, G. W. Cummins, S. Hudson, W. Warren, F. Q. Lane, T. J. Saltmarsh, A. W. Sutton, T. F. Rivers, and Dr. R. Hogg.

Messrs. J. Cheal & Sons, Crawley, sent a collection of about 50 dishes of Apples, all well kept specimens of popular varieties; and from Mr. Leach, Albury Park Gardens, Guildford, was a basket of fruits of Ham Green Favourite Tomato, and some fine Coldstream Leek.

At the conclusion of the sitting a vote of condolence with Mrs. Wildsmith, on the death of her husband (who had been for so many years an active member of the committee), was proposed by Mr. A. W. Sutton, and unanimously adopted.

Awards were made as follows:—

By the FLORAL COMMITTEE.

Award of Merit.

Helleborus colchicus coccineus, from Messrs. Paul & Son (14 votes to 1).

Medals.

Silver Banksian, to Messrs. Chas. Lee & Son, for group of hardy trees and shrubs.

Bronze Banksian, to the St. George's Nursery Co., for a group of Cyclamens.

By the ORCHID COMMITTEE.

First class Certificates.

Cypripedium Lathamianum, from Messrs. Bond, Veitch, Tautz, and Baron Schroder (unanimous).

Cypripedium cardinale, Vanner's variety, from W. Vanner (6 votes to 5).

Cypripedium porphyrochlamys, from F. G. Tautz, Esq. (unanimous).

Cypripedium Elliottianum, from H. M. Pollett, Esq. (unanimous).

Odontoglossum ramosissimum, from A. H. Smee, Esq. (unanimous).

Award of Merit.

Lycaste Skinnerii Regina, from Mr. E. A. Roberts (10 votes to 2).

Botanical Certificate.

Masdevallia leontoglossa, from A. H. Smee, Esq.

By the FRUIT COMMITTEE.

Medal.

Silver Banksian, to Messrs. J. Cheal & Sons, for a collection of Apples.

ROSES.

COMPARISONS AMONG TEA ROSES.

THESE are almost necessarily more or less vividous, if not worse, and as almost every Tea has its special patron who prefers it to most or all others and of course all depreciatory comparisons bring hosts of admirers to the defence. This is just as it should be, perhaps, as it may prevent any good Roses from slipping into oblivion, because, forsooth, there are others as good or better in show boxes, Rose beds, or borders. Notwithstanding the wonderful widening of the field, and enriching of the character of Tea Roses within the last thirty years, yet the exhibitors in classes of twelve, do not find any superabundance of good blooms for their Rose battles; and hence it is well to be conservative of flowers of capacity or of promise, though they may frequently fail in reaching their highest and best. Whereas for bed or border, the more the brighter, and the greater the distinctness, if not actually the better.

All this is but preliminary to my defence of those Roses somewhat invidiously compared by "Wild Rose." With much of what he so truly says on pages 131-132, most rosarians will heartily agree; but when he ventures to relegate Marie Van Houtte to an inferior place to Anna Olivier, then there will be a rush for him among many growers and showmen of Teas. Not that I will follow his example by attempting to depreciate Anna Olivier; it is exquisitely perfect, superbly beautiful—but so is Marie Van Houtte. And then just let any one take the latter as a study of colour. How wide is the range—how exquisitely soft and delicate the finish! No, I will not place Marie Van Houtte second even in such good company. Possibly Anna Olivier is the more useful Rose to the "hack exhibitor," who is on the road night and day throughout the show season. But for perfection and beauty, abreast with them, please; or if there is to be a preference, Marie to the front—but no, I started with depreciating invidious comparisons, and will not make them. And now I venture on weaker ground—that is, Roses—in standing up for *Gloire de Dijon* and *Homere* as show blooms. Tea Roses have a wide range, extending nearly all the way from worthless to something nearly akin to perfection, of which these two varieties are examples.

Exhibitors, not of the widest experience, have cut and shown cupped blooms of the *Gloire*, that have remained cupped throughout long and trying show days, and have hardly lowered the beauty of such distinguished associates as *Souvenir d'Elise*, *Innocente Pirola*, or others equally perfect—not that the *Gloire* should be pitted against these or other Roses—as it is strong enough to stand alone through all the Rose garden fair, and may occasionally do so in the show-box, when a judicious selection of blooms is made. And then as to *Homere*, the only fault "Wild Rose" has against it when perfect is its small size. Against its lack of barrel bulk I respectfully pit its perfect form (when perfect) and its unique cupful of mottled mixed blush, salmon, and rose. We have nothing approaching it in character and colour in the rich field of Teas, and I have seen perfect bushes of *Homere* excite more enthusiasm than those of *Maréchal Niel* and *Belle Lyonnaise* on either side of them. "So much the more for the enthusiasts!" "Wild Rose" will exclaim. Will no one join me in retorting, "So much the better!" *Rosa*.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending February 8th, is furnished from the Meteorological Office:—

"The weather during this period has been finer and more settled than for many weeks past. Over the greater part of the Kingdom the conditions have been dry and the sky frequently cloudless, but at some of our south-eastern stations—and notably in London—a good deal of cloud has prevailed, accompanied, at times, by slight drizzling rain. Fog or

mist has been experienced occasionally in all districts.

"The temperature has continued a little above the mean in the extreme north and north-east of Great Britain, and has just equalled it in Scotland, W., but in all other districts it has been rather below. The highest of the maxima, which were recorded in most cases either on the 2nd or 3rd, ranged from 50° to 54° over Scotland, and from 48° to 52° over Ireland and England. The lowest of the minima were registered on very irregular dates, and ranged from 23° in Ireland to between 23° and 25° in Scotland, and from 23° to 27° over England. In the "Channel Islands" the lowest reading was 33°.

"The rainfall has been much less than the mean in districts. Many parts of the kingdom have been almost rainless.

"Bright sunshine shows a very general and decided increase, and, taking the country as a whole, has not been so prevalent in any week since that which ended October 4th, 1880. The percentage of the possible amount of duration ranged from 28 in the Midland Counties to 43 in the "Channel Islands," 47 in "Scotland, E.," 48 in "Ireland, S.," and 50 in "England, S.W." In London only 8 hours were recorded, which was less than at any other station in the kingdom."

(By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

MARKETS.

COVENT GARDEN, February 13.

(We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Etc.)

No remarks this week, with exception of Grapes, which are getting confined to few samples, and are steadily rising. James Webber, Wholesale Apple Market.

ORCHID-BLOOM IN VASETY.

SEEDS.

LONDON: Feb. 12.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, write that to-day's market was thinly attended, with a quiet inquiry for farm seeds. Trade still continues still a favoured article, and commands higher prices. Albske is scarce and firm. In white there is not much doing. As regards Red Clover seed the supply exceeds the demand. Rye grasses are cheap and neglected. As Koenigsberg Spring Tares are this season both dear and bad, English Winter Vetches are taking their place. Some fine new Scarlet Runner Beans are now offering on moderate terms. Low prices still prevail for Birdseeds. Blue Peas and Haricot Beans are in meagre demand.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quart.), for the week ending February 8.—Wheat, 28s. 9d.; Barley, 31s. 10d.; Oats, 18s. 7d. For the corresponding period in 1889:—Wheat, 29s. 7d.; Barley, 26s. 4d.; Oats, 16s. 7d.

FRUITS AND VEGETABLES.

SPITALFIELDS: Feb. 12.—The supplies none that exceed the demand, trade being very heavy. Large quantities of Potatos at market and prices low, except for very best samples. Prices:—Turnip-tops, 1s. to 1s. 6d. per sack; Sprouting Broccoli, 1s. to 1s. 6d. do.; do. 6d. to 9d. per sieve; Spinach, 9d. to 1s. 6d. per bushel; Savoys, 2s. to 3s. per tally, Cabbages, 1s. to 2s. do.; Cauliflowers, 3s. to 6s. do.; Curley Kale, 9d. to 9s. per bushel; Seakale, 1s. to 1s. 6d. per punnet; Beetroot, 3d. to 6d. per dozen; Parsnips, 4d. to 6d. per score; Greens, 3d. to 1s. 3d. per dozen bunches; Turnips, 1s. 6d. to 2s. 6d. do.; Carrots, 1s. 6d. to 2s. do.; Parsley, 2s. to 3s. do.; Horseradish, 1s. to 1s. 4d. per bundle; Celery, 4s. to 9s. per

dozen bundles; forced Rhubarb, 1s. 6d. to 2s. do.; Spanish Onions, 8s. to 10s. per case; Bordeaux do., 6s. 6d. to 7s. do.; English do., 8s. to 9s. per cwt.; Belgian and Dutch do., 6s. to 7s. 6d. per bag of 110 lb.; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Cabbage Lettuce, 1s. 6d. to 2s. 6d. per dozen; Endive, 1s. 6d. to 2s. do.; Carrots, 17s. to 26s. per ton; English Apples, 5s. to 7s. per bushel; American do., 17s. 6d. to 24s. per barrel.

STRATFORD: Feb. 11.—Supply has been good during the past week, and a fair trade was done at the following prices:—Savoys, 3s. to 6s. per tally; Cauliflowers (Guernsey), 2s. to 3s. per barrel; do. (Cornish), 5s. to 8s. per crate; Turnips, 25s. to 35s. per ton; Carrots (household), 30s. to 40s. do.; do. (cattle feeding), 20s. to 25s. do.; Mangels, 14s. to 18s. do.; Swedes, 14s. to 18s. do.; Onions, English, 120s. to 130s. do.; do., Dutch, 6s. to 7s. per bag; do., German, 8s. 6d. to 9s. do.; Apples, American, 36s. to 24s. per barrel; Watercress, 6d. per dozen; Celery, 7s. to 12s. per dozen bundles; Rhubarb, 1s. 9d. to 2s. do.; do., English, 5s. 6d. to 4s. do.; Cress (hot and cold), 7d. per dozen baskets; Mushrooms, 10s. do.; Kale, 15s. to 18s. do.; Sprouts, 1s. to 1s. 6d. per half-sieve; Radishes, 10d. to 1s. per dozen bunches.

POTATOS.

BOROUGH AND SPITALFIELDS: Feb. 11.—Quotations:—Regents, 40s. to 55s.; Hebrons, 40s. to 50s.; Magnums, black land, 40s. to 50s.; Bedford, 40s. to 55s.; Lincoln, 45s. to 65s.; Yorks, 30s. to 70s.; Scotch, 50s. to 95s.; Imperators, 40s. to 70s. per ton.

SPITALFIELDS: Feb. 12.—Quotations:—Early Rose 40s. to 50s.; Regents 50s. to 55s.; Hebrons, 10s. to 60s.; Imperators, 50s. to 70s.; Champions, 30s. to 55s.; Magnums, 10s. to 60s. per ton.

STRATFORD: Feb. 11.—Quotations:—Scotch Magnums, 50s. to 80s.; do. Regents, 55s. to 70s.; light English Magnums, 30s. to 65s.; dark, do., 40s. to 15s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, special (1887), 120s.; prime, 78s. to 98s.; do., inferior, 46s. to 75s. Best hay, 60s. to 90s.; do., special (1887), 100s.; do., inferior, 25s. to 50s. Straw, 28s. to 40s. per load.

seven years of age. Of Scotch extraction, Mr. Micklewright served in some gardens south, notably Stoke Park, Slough, and Shrubland Park, under Blair; he then was head gardener at Greystoke Castle, Cumberland for eleven years. Coming south again, he was with Mr. W. Brown of St. Mary's nursery, Richmond, for a time; being also a member of the Horticultural Society's committee. From thence he came to Spring Grove, to undertake the charge of a place which Mr. Pears with exceeding liberality purposed reconstructing, and at the time of his death, much of the work, especially so as relates to the houses, kitchen and fruit gardens, had been accomplished, though much remains to be done. The deceased was also a member of the committee of the Hounslow Horticultural Society. He was a very estimable man, widely respected, and enjoying the entire confidence of his employer. A large number of gardeners and others attended his burial, which took place in the Heston churchyard on Monday last.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

FUCHSIAS.—Count Solus v. Laubach, Professor of Botany in the University of Strasburg, is desirous of obtaining cuttings of Fuchsia Strandsii, F. Torreyana, F. exoniensis, F. Gtiant de Versailles, F. Attraction, F. Colossa, F. President, F. Dominyana, F. Prince Jerome, F. pendulina, F. excorticata, F. corallina, F. macropetala, F. apetala, F. Quindimaria, F. cinnabarina, F. radicans, F. Venus vitrius, F. discolor, F. cylindracea. Amateurs are requested to communicate with the Count as above.

NOTICES TO CORRESPONDENTS.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

Obituary.

MR. J. M. MINTOSH.—There passed away on February 1, at Victoria Terrace, Dumfries, after a lingering illness, Mr. Mintosh, who had attained the great age of ninety years. Mr. Mintosh belonged to a family distinguished in horticulture, and for a period of twenty-nine years he filled with great ability the position of head gardener at Drumlanrig Castle. Twenty-two years ago he was obliged by failing health to retire, and the long evening of his days has been passed in peaceful retirement in the neighbourhood of Dumfries. His father was gardener to Mr. Murray of Abercromby, near Crieff. While the deceased was in the service of the Duke of Buccleuch in Dumfries, his brother Charles (who was the author of *The Book of the Garden*, published in 1853 and 1855, and other horticultural works) occupied a similar position in his Grace's employment at Dalkeith Palace; and it is a curious coincidence that on their retirement they were succeeded by two brothers—Mr. William Thomson, now of Clovenstone, going to Dalkeith, and Mr. David Thomson to Drumlanrig. The late Mr. Mintosh led a very retired life, but enjoyed the warm attachment of a circle of personal friends.

MR. MICKLEWRIGHT.—We regret having to record the death, after a very short illness, of Mr. Micklewright, who for the past three years had been gardener to Andrew Pears, Esq., of Spring Grove House, Isleworth, once the residence of Sir Joseph Banks. Mr. Micklewright was seized with an attack of influenza on the 2nd inst., and expired on the morning of the 6th, at the comparatively early age of 44 years. He leaves a widow and three boys, the youngest of whom is

CALITRIS. B. M. Many thanks, the plant is really Australian, but has been conveyed to the Himalayas.

CURRANT BUD DISEASE. T. D. Smith. Due to the attacks of a mite, see *Gardeners' Chronicle*, February 16th, 1888. Burn the affected shoots.

DISEASED SILVER FIR. G. H. The disease is the consequence of the attack of a fungus called *Ecdium elatinum*. As the growth of the fungus is internal, we fear there is no remedy beyond destroying by fire all the affected branches, and this would hardly be practicable.

GRAPE VINES AND VEGETABLES FOR FLORIDA: A. There is no book that we know of which gives just the information you require. Get *Select Plants for Extra Tropical Countries*, by Baron Ferd. von Mueller, published at Calcutta, Office of the Superintendent of Government Printing.

HEMANTHUS KALMBREYER: J. E. When at rest a cool dry house, or a shelf on the wall of a vinery from which frost is kept out, will suit this or any other *Hemanthus*; no water is then required. When started to grow in April, or earlier, the warmth of an intermediate-house, and later that of a stove, will be best. Grow it in well-drained sandy loam, made very firm. Deep pans are better than pots. Keep half the bulb above the surface, and re-pot every third year.

NAMES OF PLANTS: T. Price, Stonehouse, Gloucester. 1, *Viola lutea*; 2, *Antennaria dioica*; 3, *Cerastium arvense*; 4, *Sedum acre*, var.; 5, *Veronica repens*.—*Jaw Egge*. *Helleborus colchicus coccineus*.—*Constant Reader*, 1, *Correa hybrida*; 2, *C. bicolor*; 3, *Abutilon Sellowiana marioratum*.—*L. L.* *Lonicera Standishii*.—*F. W.* 1, *Mentha species*, send in flower a better specimen; 2, *Eugenia species*, send in flower or fruit; 3, *Nerium Oleander*; 4, *Jasmine*, probably, send in bloom; 5, *Euonymus japonica aurea variegata*;

6, *Aralia Sieboldi*.—*X. M. St. Bredads*. We have done our best to name your specimens, but with very little success, as the leaves of many species are very similar and vary greatly, flowers and fruits are required for their correct identification; 1, *Eucalyptus*; *Stuartiana*? 2, *E. Globulus*; 3 & 4, *E. amygdalina*? 5, *Juniperus taxifolia* (commonly called *oblonga pendula*); 6, *Juniperus rigida*; 7, *Cupressus torulosa*.—*W. Hopkins*. 1, *Sequoia sempervirens*; 2, *Thuja orientalis* var. *Sieboldi*; 3, *Cupressus*; 4, *Juniperus taxifolia*, commonly called *oblonga pendula*; 5, *Cupressus*, perhaps *torulosa*; 6, *Thuja Wareana*; 7, *Juniperus*; the wretched scads you send only enable us to guess at the names.—*J. W. I. Retinospora pisifera aurea*; 2, *The Atlas Cedar* so far as we can tell; 3, *A variety of the Douglas Fir*; 4, *Picea orientalis*.—*J. S. I. Picea nigra* (probably); 2, *Pinus Strobus*; 3, *A variety of the Douglas Fir*, probably the form known as *Stairii*; 4, *Cedrus*, probably *atlantica*; 5, *The Golden Scotch Fir*—we never saw it so finely coloured; 6, *A variety of the Douglas Fir*. *B. L. Eriostemon myrporoides*.—*Camjee*. *Spiranthes colorans* (= *Stenorhynchus speciosus*).—*Hortus*. *The Heath-like plant is Diosma ericoides alba*; the other, *Sparmannia africana*.—*W. J. B. St. Aulvins*. 1, *Acacia longifolia*; 2, *A. dealbata*; 3, *A. cyanophylla*; 4, *A. affinis*; 5, *A. juniperoides*; 6, *Thuyopsis dolabrata*; 7, *Roziniana plumosa*.—*Foreman*. 1, *Dalechampia peltata*, var. *rosea*; 2, *Eriostemon pulchellus*; 3, *Goldfussia isophylla*; 4, *Acacia cyanophylla*; 5, *A. affinis*; 6, *A. dealbata*.

NAMES OF FRUIT: *T. D. S. Cats-head*, probably. **ORCHID:** *Subserifer*. A plant like an *Hibiscus*, but annual. The pods are used in the tropics as a pickle, and for the sake of their mucilage. Sow in heat, and treat as a stove annual.

ORCHID PEAT: **WOOD & SONS.**—The peat sent, seemed to be everything which an Orchid cultivator could wish for—light, scentless, full of vegetable remains. And with scarcely any soil.

PLANTS OF PALESTINE. *H. J. C.* The plants of Palestine are all included in *Boissier's Flora Orientalis*, five volumes. A list is also given in Canon Tristram's work on Palestine. Veitch's manual of Conifers; plants next week.

TOMATOES OR OTHER PLANTS, AND SYRINGING: *H. G. W.* Heat and excess of moisture in the air tend to a large development of foliage, and if accompanied with want of ventilation, blanching of the same will occur, and other undesirable features, as leaf warts and air roots. Tomatoes grow and fruit better when kept on the side of dryness at the roots and of the air.

TRADE NOTICE.

At Antwerp a new General Horticultural Agency has recently been established by Messrs. D. Herdt & Stricker, with M. Jean Degreave, a gentleman of great experience, as manager.

DANIELS' POTATOES

THE MOST WONDERFUL CROPPING POTATO IN THE WORLD.

Price 2s. 6d. per peck, 8s. per bush, 21s. per sack. Much cheaper by the ton.

EVIDENCE OF SUPERIOR QUALITY AND PRODUCTIVENESS.

From Hundreds of Unsolicited Testimonials received we select the following:—

From Mr. H. HAMMERBORN, Woodchurch.

"I have had the honour of winning the SILVER CUP offered for our show for the best collection of Potatoes. I sowed 123 varieties, 68 of which I had direct from you. I grew 117 varieties, and the best cropper by far was THE DANIELS."

Quantity Plant'ed, 1 1/2 lbs. Quantity Raised, 72s 1/2 lb.

From the "RETTINGER GUARDIAN," September 14.

"REMARKABLE POTATO YIELDS.—Mr. G. Johnson, o' Wadcroft, has a crop of Potatoes remarkable both for size and quantity. He purchased 14 1/2 lb. of THE DANIELS seed from Messrs. Daniels Bros., Seed Growers, Norwich; and the 11 lb. of seed realised no less than 72s 1/2."

Before ordering, send for Daniels' New Potato Catalogue, containing Coloured and other Illustrations, and much valuable information. Gratis and post-free to all.

DANIELS BROS., Exchange Street, NORWICH.

GARDEN REQUISITES.

"Frigi Domo"

CANVAS.

From Damp, Frost, and Cold Winds. A perfect Non-Conductor of heat, keeping wherever it is applied an even temperature.

NOTICE.

The words "Frigi Domo" are registered as a Trade Mark, and in two recent actions of Benjamin Edgington, Limited, Plaintiffs, v. John Edgington & Co., Defendants, and Benjamin Edgington, Limited, Plaintiffs, v. Osman & Co., Defendants, judgments have been obtained against the Defendants for a Perpetual Injunction, restraining them from using the words "Frigi Domo" as a Trade Mark for any material intended to be used for Horticultural or similar purposes not manufactured by or for the Plaintiffs or selected by them, and the Defendants, John Edgington & Co., and Osman & Co., were ordered to pay Damages and Costs.

The Best and Cheapest Fuel for Greenhouse Boilers, Stoves, and Heating Apparatus.

HENDREFORGAN ANTHRACITE

SMOKELESS COAL.—THE UNITED ANTHRACITE COLLIERIES (Limited) supply their Nut or Cobble Coal (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered in truckloads to any railway station. This coal is ABSOLUTELY SMOKELESS, and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than coke. Quotations can be had on application to the Company's Offices, 23, Lime Street, London, E.C.

Quotations for London delivery can be obtained for the Northern, Western, and South-Western districts, from Messrs. G. R. CARTER and SON, Coal Exchange, E.C.; and for the South-Eastern district, from Messrs. W. DOWELL & CO., Coal Merchants, Greenwich, S.E.

TO FLORISTS.—Wanted, by a young Lady, re-engagement in high-class Florist's Business. Good references.—E. H., 49, Hampton Road, Clifton, Bristol.

HOLLOWAY'S OINTMENT and PILLS.—Coughs, Influenza.—The soothing properties of these medicaments render them well worthy of trial in all diseases of the respiratory organs. In common colds and influenza the Pills, taken internally, and the Ointment rubbed over the chest and throat, are exceedingly efficacious. When influenza is epidemic, this treatment is the easiest, safest and surest. Holloway's Pills purify the blood, remove all obstacles to its free circulation through the lungs, relieve the over-gorged air tubes, and render respiration free, without reducing the strength, irritating the nerves, or depressing the spirits; such are the ready means of escaping from suffering when afflicted with colds, coughs, bronchitis, and other chest complaints, by which the health of so many is seriously and permanently injured in most countries.

HEATING! HEATING!! HEATING!!! THE THAMES BANK IRON COMPANY,

Undertake the complete erection of **HEATING APPARATUS FOR GREENHOUSES, OFFICES, PUBLIC BUILDINGS, &c.** Have the largest stock of **BOILERS, PIPES, and CONNECTIONS** in the Trade, and invite inspection of same.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, building the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

WEBBS' NEW PEA
"ROYAL STANDARD."

"PEA—WEBBS' ROYAL STANDARD. This is a distinct and excellent New Pea. It grows from 5 to 6 feet in height, has an extremely large constitution, is enormously prolific, with thick, wide, blunt pointed pods of the No Plus Ultra type, but much larger. It merits a high place amongst main crop and late sorts, and its flavour at all times is second to none. I have tried scores, and might safely say hundreds of new Peas during the last ten years, and this is one of the few that have given me complete satisfaction. From Mr. J. MITCHELL, Gardener to C. R. M. Talbot, Esq., M.P., Mar. 20, 1888.

"STANDARD" SEEDS.

NEW BROCCOLI. SHARPE'S MONARCH.

This fine Broccoli was raised by a Gentleman's gardener in the Midlands, and judging from the reception it has received in the Birmingham and other important markets, it will, no doubt, become the kind for market purposes, being thoroughly reliable, and producing large, pure white heads; commanding prices ranging up to 3s. per dozen. The flower is well protected by the foliage until ready to cut, when the leaves fall back and expose a magnificent head of from 12 to 15 inches diameter, very firm and clear, of great weight, and entirely free from mossy or discoloured portions. Its season is from the middle of March to the end of April, and we have no hesitation in recommending this as being one of the best Broccoli sent out for years.

Price, per Sealed Packet, 1s. 6d. POST-FREE.

CHARLES SHARPE & CO., SLEAFORD, LINCOLNSHIRE.

THE SMITH AND SONS, Darley Dale Nurseries, near Matlock.

HARTLAND'S 56 page "YEAR BOOK" of the **SEEDS** for 1890.

Within itself unique in the extreme. His "Book of Daffodils" has no rival in the United Kingdom. His "Book of Seeds" for 1890 is not like any other publication throughout the British Isles, and those who seed and plant offered that no other house has yet attempted to offer. Send three stamps to cover postage, &c., and a note for copy, which contains some rare hardy plants.

W. B. HAYCOCK HARTLAND, Old Established Seed Warehouse, 24, Patrick Street, Cork.

The Best Present for a Gardener.

VEITCH'S FLOWER SEEDS,

THE FINEST IN CULTIVATION.

VEITCH'S COLLECTIONS of CHOICE FLOWER SEEDS in the Original Sealed Papers, as imported from the most celebrated Continental cultivators.

DWARF CHRYSANTHEMUM ASTER.

A magnificent variety, bearing enormous flowers. Collection of 12 distinct colours, separate, 2s. 6d.

VICTORIA ASTER.

The finest Aster; grand for exhibition. Collection of 12 distinct colours, separate, 3s. 6d.

TRUFFAUT'S IMPROVED PÆONY PERFECTION ASTER.

A splendid incurved variety, of great size and symmetry. Collection of 12 distinct colours, separate, 2s. 6d.

SCABIOUS.

New Dwarf, 8 varieties 1s. 0d.
Large-flowered, 8 varieties 1s. 0d.

ANTIRRHINUMS.

Assortment of 10 finest varieties, separate, 2s. 0d.

For full descriptions of the above and other Choice Novelties and Specialties, see SEED CATALOGUE for 1890, forwarded Gratis and Post-free on application.

VEITCH'S SUPERB BALSAM.

Collection of 8 beautiful colours 2s. 6d.

DIANTHUS CHINENSIS.

The finest and most beautiful varieties. Collection of 12 varieties, separate 2s. 6d.

DOUBLE HELICHRYSUMS.

Beautiful Everlasting Flowers. Collection of 10 splendid varieties 2s. 0d.

LARKSPURS.

Double Dwarf Rocket Hyacinth-flowered. 10 distinct varieties, separate 2s. 0d.

VEITCH'S SUPERB PETUNIAS

Assortment of 10 finest large-flowering varieties, separate 2s. 6d.

PHLOX DRUMMONDI GRANDIFLORA.

Assortment of 12 brightest and most distinct colours 2s. 6d.

LARGE-FLOWERING GERMAN TEN-WEEK STOCK.

The most popular Stock in cultivation. Collection of 12 distinct colours 2s. 6d.

NEW ROBUST ROCKET TEN-WEEK STOCK.

Of robust branching habit, bearing massive spikes of large double flowers. Collection of 8 distinct colours 2s. 6d.

GIANT PERFECTION TEN-WEEK STOCK.

A beautiful class, of strong growth and pyramidal habit. Collection of 8 distinct colours 2s. 6d.

VEITCH'S SUPERB ZINNIAS.

Finest Double-flowered, in 8 distinct colours, 2s. 0d.
Finest Single-flowered, in 6 distinct colours, 1s. 6d.

HARTLAND'S GOLDEN QUILLED SUNFLOWER, "SOLEIL D'OR"

WILLIAM BAYLOR HARTLAND submits the following relative to the merits of this plant. He has no other means than with such testimony of adding force to what has already been written on the subject. There is no doubt the Irish variety is quite distinct from that known in England, and he is sincerely obliged to Messrs. Pearson, Backhouse, Payne, and Cullingford for what they have written him on the subject.

* * Strong Plants (Orders now in strict rotation), 12s. per dozen; 1s. 3d. each.

Dozen lots post-free.
Single plants 3d. extra for postage.
Trade Terms on application.

"Your Soleil d'Or Sunflower is certainly perfectly distinct from the ordinary form grown in this country, and is, we think, rather richer in colour. It will be a decided acquisition to our English gardens.

"A. AND C. PEARSON,
"Chilwell Nurseries, Notts."

"We like your Soleil d'Or Sunflower very much. It is now in flower, much in advance of the ordinary form.

"JAMES BACKHOUSE AND SONS,
"Nurseries, York."

"Your box of Soleil d'Or Sunflower blooms to hand. I am much obliged for your sending them. Several of the blooms are much finer than the drawing or illustration you publish, and they form a really attractive and agreeable vaseful.

"C. HARMAN PAYNE,
"Thorn Road, South Lambeth, London, S.W."

"Dear Mr. Hartland,—I am writing to tell you how very pleased I am with your quilled herbaceous Sunflower. I have grown nearly all the varieties of Sunflowers for many years, but of all the double flowers I consider this the very best.—Yours truly,

"W. H. CULLINGFORD,
"Earl's Court, Tunbridge Wells, London."

* * The plant has also been sent to Kew and Chiswick Gardens for trial, and **PRONOUNCED QUITE DISTINCT.**

* * Year Book of Seeds for 1890, now ready.

WILLIAMS' GOLD MEDAL STRAIN OF PRIMULA IS THE BEST,

AND HAS SECURED NUMEROUS
GOLD MEDALS IN EXHIBITIONS,
BOTH AT HOME AND ABROAD.

EVIDENCE OF QUALITY.

From Mr. MCNTZ, *The Gardens, Northlands, Winchester*.—"I took First Prize at our Winchester Show, in 1889, with Primulas grown from your celebrated strain in various classes; the entries were numerous, from 20 to 30 competing. My exhibits were greatly admired on account of the superiority of the strain."

From Mr. R. WELLER, *The Gardens, Glenstal, Ireland*.—"I have had wonderful success with your seeds. Primula, in particular, has beaten all others in the county."

From Messrs. R. AND J. FARQUHAR, *Boston, U.S.A.*.—"Your Primulas have given good satisfaction. The results have been most favourable, consequently Williams' strains are much called for."

FRAGRANCE IN FERNS.

AT a recent meeting of the Royal Botanic Society, Regent's Park, the Secretary, Mr. Sowerby, drew attention to the fragrant odour emitted by dried leaves of Polypodium (*Drynaria*) *Wildenovii*, an odour resembling that of fresh hay, and which the leaves retained for many months after being dried. Mr. Sowerby thought the plant might be grown as a source of perfume by amateurs.

A plant of this Polypodium was obtained for Kew from Mr. Sowerby. It is not, however, *P. Wildenovii*, a species not in cultivation so far as I know, but the well-known *P. Phymatodes*, of which we have many large examples at Kew, and the fragrance of which has long been known. The fronds are used by the South Sea Islanders for perfuming Cocoa-nut oil. About five years ago, a living plant and some dried fronds of this species were presented to Kew by Mr. Collins, of the Strand, who stated that the fronds were employed in his house for placing amongst clothing, &c., to which they imparted an agreeable and lasting perfume. I have the dried leaves still, and they are as fragrant now as when I received them. The odour is exactly like that of the Tonquin Bean, *Dipterix odorata*, used for scenting snuff and other forms of Tobacco. Specimens of *P. Phymatodes*, which have been in the Kew Herbarium nearly thirty years, are very perceptibly fragrant now, notwithstanding the strong dressing of corrosive sublimate which they have received. An allied species, viz., *P. nigrescens*, proves quite as fragrant when dried; and a third one, also closely allied to *P. Phymatodes*, viz., *P. pustulatum*, a native of New Zealand, is even more fragrant than these. The natives of New Zealand employ the fronds of this species to scent their oil and food.

In the *Daily News* for last Saturday there is a letter from a correspondent who has resided in the North West Provinces of India, where, he states, the fronds of *P. normale* are gathered and placed in rooms for the sake of their delicious hay-like scent. He also states that "it is, of course, the naked seeds at the back of the strap-shaped

leaves, which, being ripe at that season, give out the sweet smell which floats on the air in the golden pollen-like particles."

For one who begins by sneering at the Royal Botanic Society for its want of knowledge on the subject of sweet-scented Ferns, the belief that the fragrance is caused by the pollen-like particles is amusing. Certainly the spores have nothing to do with it, barren and young fronds being quite as fragrant as the fertile ones. There is no fragrance from these Phymatodes Polypodiums unless the leaves are dried or drying. The odour appears to be due to the presence of numerous oil glands in the fronds.

Evidently the leader writers for the London daily papers are unacquainted with the several native species of Fern, the fragrance of which is well known. The scent of hay is so married in Nephrodium (*Lactrea*) emulmum, that it is commonly known as the Hay-scented Buckler Fern, and one of its synonyms, viz., *N. fonsicci*, Lowe, means "hay-cutter." *N. montanum* emits, when bruised, a lemon-like odour, which is due to the presence of numerous minute glands on the under-surface of the fronds. *N. fragrans*, a native of the North Temperate zone, but not British, has a strong primrose-like odour, both when green and when dried, herbarium specimens retaining the fragrance for many years. It is stated that, in Siberia, a decoction of the leaves of this species is a pleasant substitute for tea. *N. odoratum*, a widely distributed plant, has a pungent mustard-like odour and taste. A common plant in gardens, and represented by large tufts in the Temperate-house at Kew, is *N. patens*, a species similar to *N. molle*, and almost as widely distributed, and which emits when bruised a strong odour suggestive of very ripe Apples. *Dicksonia punctiloba*, a North American plant, is known in Kentucky as the Sweet-smelling Fern, on account of the fragrance of its fronds. Probably there are many other species possessed of fragrance; those here mentioned are, however, all that are known at Kew.

The economic properties of Ferns are few and unimportant. A few are of medicinal value; the Sage-like pith of *Cyathea medullaris* affords an article of food to the natives of New Zealand; the tubers of *Neprolepis tuberosa* are eaten in Nepal as we eat Potatoes. The Braeken of our commons and woods is perhaps the most useful of all; its fronds are burnt for the sake of the alkali of their ash, which is used in soap and glass-making; the rhizomes are used as food, and the young fronds when boiled are said to be as delectable as Asparagus. *Helminthostachys zezlanica* in Ceylon, and *Botrychium virginicum* in New Zealand and Northern India are eaten in the same way.

The prevalent belief with regard to the name "Maiden-hair" for *Adiantum* is, that the fronds are hair-like in their drooping elegance and lightness. According to J. Smith, however, this name "is derived from the circumstance of a syrup being prepared from *A. Capillus-venenis*, and which is known in commerce as *Capillaire*; it is slightly odoriferous, or made so by the addition of orange-flower water, and is used by women for dressing their hair, and for promoting its growth." *A. pedatum* is similarly employed in North America. A plant in gardens under the name of *A. fragrantissimum* is reputedly fragrant, but we can not detect any odour in the example of it at Kew.

I find that the fronds of the hay-scented Polypodiums, when cut and placed in a room, give off a most agreeable fragrance, and on this account alone they deserve to take rank with Rosemary, the petals of Roses, and Lavender, so well known as ingredients in *Pot-Pourri*. *W. Watson*.

ROSES.

THE PRUNING OF HARDY ROSES.

AMONG the various special prunings of semi-tender and show Roses, there is considerable danger that the art of pruning hardy ones will be scamped or unlearned. Various causes work in this direction—such as the few hardy Roses grown, doubts as to the wisdom or need of pruning them, and uncertainty as to the time and extent of such pruning.

Most true rosarians deeply regret the decline of hardy Roses. True, most of these bloomed but once a year; but then they did flower well once, and that is more than can be said of a good many of their successors, though it may also be said of them that few modern Roses have ever exceeded the older hardy ones in colour and fragrance. The Rose Conference at Chiswick will not have been held in vain if it brings about a *renaissance* of the older and hardier Roses. It has already done so, and probably never within the last half century have so many of these Roses been sold as during the planting season now drawing to a close. Hence, in the near future cultivators are likely to have more hardy Roses to prune, and it becomes, therefore, of more practical importance to know how to do it.

Like the pruning of almost all Roses, the matter resolves itself into the two opposite extremes of hard or short, or long prunings to cut back to one or three buds, or to leave from six to a dozen, and both may be best, according to circumstances and sorts. For example, the common Moss, white, and other Provence, bloom most perfectly cut back hard and close. This not only limits the sizes of the plants to the convenient size of squat bushes for bed or border, but results in blooms of great perfection, and probably abnormal colour and fragrance. Hence while mere perfection of bloom and limitation of area are the chief objects, hard pruning is best.

But hardy Roses have an important place in the landscape, as well as in the flower-bed or border, and used for several purposes, probably the less they are pruned the better.

The less pruned, the more picturesque hardy Roses as rough ramblers, bushes, masses, or trees become. There are those that contend that Roses must be pruned; that if not pruned by art, Nature takes the process into her own hands, by starving down the tops to artificial dimensions. The process proceeds somewhat as follows:—The less the tops are pruned, the less vigorously they grow; simultaneously with this reduced vigour of crown, there are mostly developed suckers from the roots or root-stocks, or near the base of the stronger shoots or stems. These cut off the supplies from all portions of the Rose tree or bush at a higher altitude, and the Rose is pruned by the compound process of depletion and exhaustion.

This brings us to our last point—the extent and time of pruning our hardy Roses. The extent may vary from the hard and fast pruning of dwarf hardy Roses to a few buds, to pruning of different lengths, ending in the prune not at all of the landscape artist. And it must be confessed that the latter results in filling in the landscape with some of its richest furniture. Who that has seen the common Sweet Briar, or Dog Rose, or Garden Rambler, or fast-growing Ayrshire Noisette, or other vigorous growing Rose planted in rich soil, with room for development, left wholly unpruned, will ever forget the prodigal harvest of grace and beauty that have resulted from simply giving Nature her head. Many of the more vigorous hybrid perpetuals, hybrid climbers, Bourbons, and more vigorous Teas and Noisettes are equally admirable, when left almost as wild and free. Had standard Roses been given their heads more freely, they might still have been counted by thousands in gardens, where hundreds or tens barely rear their heads to-day. Close pruning converted their possibilities of picturesque beauty into formal masses, while the hard pruning indulged in reconciled them to their scarecrow deformity as well as deprived them of the power of outgrowing it—and

yet the tall stems endowed standard Roses with coigns of vantage from which the more effectively to display their picturesque beauty. Nearly all that was needed to reap such charming results in quantity, sufficient to transform thousands of gardens, was to let the Roses have their heads and leave them severely alone. But from the day that standard Roses were hard pruned for show blooms, their days were numbered as objects of art, for stiffness and ugliness could hardly be pushed further among Roses than the setting of these shoots—two buds long each on the top of stems from 3 to 5 feet high in the sight of heaven and earth.

As to the time of pruning hardy Roses, the earlier after the fall of the leaf the better. If the leaf does not fall so soon after the fall of the leaves of Gooseberries and Currants, the better. In our first prunings of hardy Roses, the pruning followed hard in the wake of these, and we have never seen finer Moss, Provence, Damask, Cabbage, Maiden's Blush, nor other hardy Roses than those that were always pruned before the close of the year. *D. T. F.*

TONGUES IN TREES.

(Continued from p. 19.)

THERE'S WIT IN EVERY FLOWER, IF THOU CANST GATHER IT.

WE can do no more than hint at the rich store of literary allusion to our wild flowers which abounds in all English poets, and the beautiful thoughts suggested to many of them by some particular plant. It would be pleasant to quote Chaucer's lines upon the Daisy, Herrick's on the Daffodil, Burns' on the Dog-rose, Shelley's on the Sensitive Plant, Southey's on the Holly, Wordsworth's on the Lesser Celandine, Longfellow's on the Compass Plant, Crabbe's on the "grave flora" of the Suffolk Fens; to cite volume upon volume of Elizabethan and of later days; to enumerate and discuss the flowers with which Ben Jonson bids "strew, strew the smiling ground;" the "pretty paunce and cherisance" of Spenser; the quaint enamelled eyes that decked the laureat barge of Lycidas; the "silver globes of Gauides Rose" which won the heart of Cowper; the slight Harebell which raised its head uncursured by the airy tread of Ellen Douglas; poor love-lorn Wilfrid's exquisite song of the Cypress wreath in Rokeby Hall; Tennyson's "Laburnums, dropping wells of fire;" or the slender Galingale, which bordered the meadows of the lotus-eaters. We should like to recall the lessons of natural theology which Paley drew from the "little spiral body of the Dodder seed;" of the "star-shaped shadow" of the Daisy which Archer Butler showed to Wordsworth; of the ecstasy with which Linnaeus, when he first saw the wild Broom in flower, "kneelt before it on the sod, for its beauty thanking God." Above all should we delight to turn the floral page of Shakspeare: to read of the grey discrowned head of Lear wreathed with "rank fumiters and furrow-weeds;" of Perdita at the shearing-feast disparaging the streaked Gillyflowers as "Nature's bastards;" of poor distraught Ophelia distributing her Rosemary and herb of grace; of Oberon telling Puck how Love-in-Idleness was purpled with Love's wound; of Titania gaily entwining the female Ivy and sweet Honeysuckle round the sleek smooth ass's head of Bottom; of Helena and Hermia, "a double Cherry seeming parted, two lovely Cherries moulded on one stem." We should lay on those who read a spell mightier than we can forge ourselves; we should invoke allies before whom all bow as the source of intellectual happiness and growth; proclaiming that the most creative minds have drawn nutriment from these tenants of our hedgerows and hillsides, and that the knowledge of their lore helps us in its turn to interpret the sweet thoughts and apt illustrations of the poets they delighted and inspired.

THE ROLLING YEAR IS FULL OF TREE.

Yet let us not forget, in our enjoyment, poetical

or scientific, the simple pleasures, yielded at once to the accomplished botanist and to the less educated but not less observant wanderer through hedgerow, field, and garden, by the mere annual reappearance of their favourites with each returning month.

The daughters of the year,
One after one, through that still garden passed;
Each garlanded with her peculiar dower,
Danced into light, and died into the shade.

As January draws to a close, and the days begin to lengthen, the sharp green spikes of the wild Arum push through last year's leaves; and, in the warmer garden beds, or, if our lot be cast in south-western England, in the deep overgrown ravine-like ditches, the Snowdrop peeps out of the softened ground. In February come the Primroses, the wild Strawberry, the Violet, the Cuckoo-bill, and the crimson stigmas of the Hazel. In late March the meadows are filled with Daffodils and Cowslips, the fallows yellow with Coltsfoot; the Willows get out their long soft catkins for Palm Sunday decoration; while the Lesser Celandine and blue Germander, with the slender stalks and star-like blossoms of the Stitchwort, light up the hedgebanks, and the Golden Saxifrage chokes the brooks. In April comes the burst of Blackthorn with its keen east winds (the Blackthorn winter, they call it in the Midlands), the pastures brightening with the Marsh Marigold and Cuckoo-flower; Ferns uncurling in the sheltered lanes, amid Ground Ivy, Wood Anemone, Wood Spurge, Bluebell, Bogle, Dandelion, Weaselsnout, Jack-by-the-hedge, Herb Robert, Lords and Ladies. In May we have the early Orchis, Moon-daisy, Goatshead, Ragged Robin; the hedges bright with Elder-bloom and Hawthorn; tall Hemlock shooting up side by side with Cowparsnip, Campion, Foolsparsley. Opening June dismisses from our garden the last remaining loveliness of Laburnum, Lilac, and Horsechestnut; its close brings on the "high midsummer pomy" of Carnation and gold-tasted Snapdragon, and Stocks and Sweet William and Jessamine and Rose, fills the fields with St. Johnswort and Yarrow, and Milkwort and Selfheal, and Birdfoot Trefoil and Agrimony, and Vetchling and Yellow Bedstraw and Black Knapweed; the fences with Gaidlers Rose, Mallow, Honeysuckle, Privet, Bryony. With July the year is on the turn; in early August pods and leaves begin to take the place of flowers; the small short clustering carpeting blooms give way to the coarse straggling Henbane and Ragworts, and Hemp Agrimonies and Woolages; the great blue trusses of the tufted Vetch, and the pure white trumpets of the Bindweed, take possession of the hedges; and the yellowing sagittate leaves of the Blackbryony and the scarlet berries of the Mountain Ash warn us that Autumn is beginning. Late September marks the closing scene. The flowers are few and far between:

Our heart is sick and our whole soul grieves
At the moist rich smell of the rotting leaves;
but splendid colours bejewel and gild the forest trees:—

O'er the leaves, before they fall,
Such hues hath Nature thrown,
That the woods wear on sunless days,
A sunshine of their own;

but the Ivy Sunday is crowded with bees, flies, moths; the Hizzels put forth clusters ruddy-brown as those with which the satyr wooed the faithful shepherdess; the Arum thrusts its poisonous brilliant fruit between the mats of dying grass; and the meadows which slope upwards from the brooks are blue with the flowers of the Colchicum.

QUE SPARSA ALII SCHIFFERIS EGRO CARMINA NECTO.

Not because our subject is exhausted, but for fear our readers should become so, we bring our flower sermon to a close. May we hope that we have justified our text, have proved that there are "Tongues in Trees." Tongues vocal with historical no less than mythical antiquity, tongues prating of curious folk-lore, revealing scholarly secrets, commemorating forgotten customs, lighting up poetic pages; eloquent

finally with truths of design and natural selection, adapted change and imperious organic force; extending the habit of intimacy into the sense of brotherhood; elevating into unconscious devotion each fresh discovery and each new experience; exalting fellowship with Nature's moods and reverence for her works, into abiding filial homage to that creative source of Nature, "who bringeth forth grass for the cattle and green herb for the service of men." *W. Tuckwell, Stockton Rectory, Rugby.*

NEW OR NOTEWORTHY PLANTS.

PHALENOPSIS × CYNTHIA.

There appear to be other plants in existence so near to the one described by me on p. 132, that they will have to come under the same name. Messrs. Hugh Low & Co., of Clapton, have sent two flowers which quite agree in shape, though they are a little smaller, paler in colour, and with only a few of the light red spots near the base of the front lobe of the lip. In fact, they agree well in colour with *P. × leucorrhoda*, at least with the paler forms of it, two of which were also sent for comparison. The essential difference of *P. × Cynthia* is this, that although an undoubted natural hybrid, it has the remarkable anchor-shaped tendrils of *P. Schilleriana*, while *P. leucorrhoda* and *P. × casta*, both from the same parents, have the long and slender tails of *P. Aphrodite* (anabilis of gardeners). Judging from what is known of the behaviour of reversed crosses between the same two parents, it seems possible that *P. × Cynthia* may have resulted from a reversed cross. A carefully conducted experiment on this point would be of great interest.

TRICHOPILIA PUNICATA, Rolfe, n. sp.*

A graceful and very singular little *Trichopilia* has just been received from Messrs. F. Sander & Co., of St. Albans, which seems quite distinct from any described species, and for which the above name is therefore proposed. It is remarkable for having both sepals and petals spotted with numerous reddish-purple spots—a character which I do not as yet find recorded for the genus. Mr. Sander writes that it was imported from Costa Rica. *R. A. Rolfe.*

A GARDENERS' PROBLEM.

As a practical gardener who has travelled a little, kindly allow me to add my mite to the discussion consequent on the issue of Mr. Dyer's papers. Mr. Dyer is modest enough to state that botany—an exponent of which I take him to be a shining light—affords but a very insecure guide to horticultural practice. To this I say no; for what better foundation can a practical gardener have to work upon than a general knowledge of botany, geographical, economic, and structural, and, with a fair understanding of these different branches, his success in his business should be comparatively easy, his practical skill, as a matter of course, being attained by the only way of serving a lengthened term in some good gardens under the tuition of men who are masters of their profession.

* The pseudobulb sent is elliptical, much compressed, with two sharp angles, $\frac{1}{2}$ inches long by $\frac{1}{4}$ inch broad. Leaf narrow elliptic-obovate, subulate, $\frac{3}{4}$ inches long by $\frac{1}{4}$ inch broad. Raceme suberect, $\frac{1}{2}$ inches long, with three flowers. Bracts sheathing below, linear-oblong, obtuse, $\frac{1}{2}$ inch long. Pedicel with ovary, $\frac{1}{2}$ inch long. Sepals and petals sub-comovate, narrowly lanceolate, subacute, $\frac{1}{2}$ inch long, very pale green, with numerous red fish-purple spots, those on the petals a little paler than the others. Lip oblong, nearly equalling the other segments, the sub-lobes embracing the column; front lobe truncate, slightly undulate, greenish-white, keel solitary, prominent in centre of lip, and extending in a faint line to base. Column $\frac{1}{2}$ inch long, green, fibrilate at base, wings fleshy, entire. It is allied to *T. laxa*, perhaps better known in gardens as *Pilumna laxa*, which it much resembles in habit. The name is given in allusion to the spotted perianth. There is also only a *T. maculata*, Rehb. f., but the spots of this are in the leaves, not in the segments of the flower.

Nearly every one who has travelled is aware that Orchids, Ericaceous plants, Ferns, Composites, and many others flourish much better in this country under garden treatment than wild in their native habitat. But why? Given the same amount of care and attention, practical knowledge, regular attendance in the way of temperatures, application of moisture, fertilising elements, and, in most cases, the shelter of glass structures, there is no reason to suppose that they should not flourish equally as well in the land to which they are indigenous.

Take, for instance, the Crotons. During my travels I noticed a church near Popplean's Broadway, in Madras, in the grounds of which these plants luxuriated in endless variety treated as pot-plants, exceeding in colouring as they equalled in growth any that are to be seen at our horticultural exhibitions at home, and produced under the most skillful management; here the temperature which is, of course, the chief element of success, generally exceeds 70° in the shade for the larger part of the year, and is seldom below 70° at night.

Optically, Mr. Dyer says, plants do not differ from each other as regards the protoplasm constituting their life essence; this being the case, the more reason, I think, that we should know where they come from, and, if possible, under what conditions they existed when discovered, in order to form some idea how to treat them, latitude and altitude being, I consider, even of more importance than soil, although the latter is a point of knowledge not to be lost sight of.

The growth of Orchids on trees is not confined to the bare stems, as indicated by Mr. Watson; on the contrary, from my observations, very few comparatively speaking, occur in such a manner. They generally cling to the shady side of branches partially protected by moss or decaying vegetable matter, or loose bark. The majority of the best wild specimens growing in the forks of branches or natural cavities in the stem, where vegetable matter capable of absorbing or retaining moisture is generally present, and this remark applies to other epiphytes, such as *Drynaria quercifolia*, *Lycopodium filiforme*, epiphytal *Vacciniums*, &c. In fact, in a tropical forest, with its dense, almost impenetrable shade, perpetually flowing streams, and often soaking moisture from heavy dews, occur just the elements for the existence of such plants, and which we reproduce more or less naturally by artificial heat, shade, sphagnum moss, peat, &c.

No plants are better adapted to the climate of the arid and sterile regions they affect than the Cacti, Agaves, Aloes, &c., yet these thrive with singular success under liberal treatment. The Agave americana and its variegated variety can be seen in India, forming an impenetrable hedge for hundreds of miles on either side of the railway lines, which run for the most part through highly fertile regions. Nothing to equal this, I am given to understand, can be seen in the Mexican regions, where it is a native. And again, the common *Opuntia*, or Prickly Pear, and the *Lantana*, originally introduced, like the Agave, for hedges, bid fair to over-run large tracts of country in the immediate future.

The introduction and acclimatization of the various species of *Eucalyptus* and *phyllodendrous* *Acacias* in the hill regions of India was attended with signal success, down to certain degrees of elevation, and strange as it may appear, I have seen *Cryptomerias*, *Cupressus*, and other Coniferous trees, perfectly hardy in this country, thrive luxuriantly at lower elevations, where the Australian plants mentioned merely struggled for existence, all climatic influence being similar. And connected with this, I may remark that Sir J. Hooker, one of our most observant travellers, noticed the greater luxuriance of our Lebanon Cedars in England, as compared to the few survivors he saw on the Lebanon mountains.

Many gardeners have remarked on the improved appearance of the huge tree Ferns at the Crystal Palace under the management of a gardener who has travelled, whilst those planted out in the temperate house at Kew were splendid examples of their

kind when I saw them last; but I have seen in the deep ravines and *scholes* of the Nilgiri hills that splendid fern *Fern*, *Alsophila latrostris*, flourishing vigorously, and equalling in nature what we reproduce artificially, for example, *Dicksonia antarctica*.

Some travellers are prone to romance considerably—I do not say purposely—particularly those ignorant of botany, or any of the natural sciences, this being the reason why we often obtain inaccurate information about plants. An instance is fresh in my recollection of a military gentleman from India, who was inspecting a small collection of *Epacris* I had in bloom, whom I overheard assuring my employer that this purely Australian genus grew wild in any quantity round about Simla.

I regret to see that Mr. Watson discards geographical botany, and, needless to say, I do not agree with him. I quite sympathise with him over his difficulties in establishing the plant he received from Hong Kong, and judging by the way he eventually established it, I should say the consignor obtained it at a considerable altitude. I have had a little experience in connection with such importations; a year or two back, my employer brought me several large Beans, ostensibly a species of Horse Chestnut, they were similar in appearance, and he called them such. These had been received a day or two before from India, with an assurance that they were perfectly hardy. I immediately recognised them as seeds of the well-known leguminous plant known as the Sword Bean throughout the tropics, and instead of sowing them in a cool border as requested, I placed them singly in 32-pots in the Melon frame, with the result that they attained the height of 2 feet in about nine or ten weeks, and were thriving well when I left the neighbourhood. I may here add that plants of the natural order Leguminosae invariably flourish best under liberal treatment—this is a well known physiological fact which accounts for Mr. Watson not being successful with his *Camoensia* in the first instance.

Possibly I may be wrong when I advance the opinion that the beautiful Nilgiri Lily, which is reputedly difficult to grow in this country, would under some sort of natural treatment be easily cultivated, for nothing could be more simple than the way it grows naturally, its abundance, and the vigour of its flower-spikes, making it a conspicuous object in the region it affects. And what is the meaning of the numerous Fern glades, rockeries, and alpine borders in the gardens of this country? unless something approaching nature is being imitated, it is certainly not all done with a view to landscape effect. How often do our *Caladiums*, *Gloxinias*, *Achimenes*, &c., succumb to a dry-rot during their dormant period, often in a most unaccountable manner, but more often through becoming dust-dry; yet in Nature there must be some sort of capillary attraction, obscured, certainly, to an ordinary observer, whereby the tubers are rendered plump and sound by receiving the necessary amount of moisture; yet, anomalous as it may seem, I have observed that where jungle and grass-land fires have occurred and parched the ground, in addition to the usual dry season, on the advent of rain, numerous flowering gesneraceous plants—*Impatiens*, Nilgiri Lily, the terrestrial Orchid, known commercially as "Salep Misere," and numerous others—spring up spontaneously with the growth of fresh grass and vegetation.

Mr. Dyer mentions the *Plumbago* and *Rhynchospermum* as flourishing under diverse circumstances, but he omits to mention a plant better known still, viz., the *Camellia*, and the vicissitudes it has undergone in the way of temperature since it was first grown in this country, and I can recollect the time when *Jasminum revolutum* was included in a collection of stove and greenhouse plants for exhibition.

Mr. Burbidge says that Nature carries matters far past the point where the gardener stays his hand; and, broadly speaking, it does; but when it suits the gardener's purpose, he, too, encourages Nature to an extreme point, viz., the fruiting stage. What are

Messrs. Veitch and our leading Orchidists doing at the present moment but fertilising and cross-fertilising, with a view to obtaining new and improved forms; in fact, exceeding the point where Nature in its simplicity often stops short.

That knowledge is power no one will deny, whether it has been acquired through travel or by home study, and the gardeners' art may be more or less empirical, but, of course, much will depend on circumstances. Of one thing I am assured—that is although horticulture has progressed apace, a great deal more remains to be accomplished of things as yet undreamed of by our predecessors in the craft. Why should not such tropical luxuries as the Oranges, Mangoes, Durians, Mangosteens, Guavas, Caricas, &c., be cultivated here under glass as readily as our Grapes, Melons, Pine-apples, and Bananas. I have seen *Monstera deliciosa* flourish with signal success on the back wall of a flue-heated stove, and know that the *Vanilla*, *Loquat*, and *Grenadilla*, have been brought to perfection in this country; but with this I must conclude. *Head Gardener, Streatham.*

— It is, unfortunately, only too true that horticulture is carried on largely in an empirical way; but that such is always the best or shortest method of attaining the desired end, I am loth to believe. Nor can I see how empiricism can successfully compete against practice with science, and in this case, chiefly botanical, and more particularly that which relates to physiology, morphology, and geographical botany—a knowledge of which must surely give a gardener a great advantage over the pure empiricist. Supposing that two such individuals were given the same task, under conditions entirely new to both, which of them would be likely to produce the best results in a given time? I think the odds would be a long way in favour of the scientifically trained man; as besides his knowing certain fundamental truths, which, within a measurable range of limitation, must be observed, he would also by virtue of such knowledge, be better able to manipulate and adapt the various forces at command to suit his requirements. On the other hand, a pure empiricist might make many experiments before succeeding, that is, if he succeeded at all. Of course, I do not contend that the scientific experimenter can always at first prescribe the correct treatment; but there is this advantage and broad distinction between the two—the one employs his forces in the direction which have every chance of leading to a successful solution of the problem, while the other, or empirical, employs his forces without being able to forecast the results likely to ensue; indeed, he may have done that which the other side could, almost with a certainty, have predicted, could but end in failure; and, therefore, I cannot see how empirical experiments can be classed as scientific research.

Touching the question as to whether the gardener is much the better for knowing the conditions under which plants flourish in their native habitats, I think such information is of the greatest importance, in enabling the gardener to shape his treatment of the new comer; but should they be such that it is practically impossible to reproduce them exactly, yet they will be valuable data to start from. Moreover, under scientific manipulation, that which may not be attainable may often, in a great measure be compensated for by modifying or otherwise altering the conditions, so that they shall nearly approach those of their natural state. Many epiphytal Orchids are cultivated in this way. But where practicable, I have always found that when the natural conditions under which they live can be reproduced in our houses, that is generally found to be a satisfactory basis upon which to work.

As an instance of this, I may mention *Amomum magnificum*, which flowered with us last December—a Madagascar plant, which has been introduced into the Mauritius; but Sir Henry Barkly told me that it only flourished on the banks of streams, sending its thick creeping rhizomes along the edges of the banks, with its roots descending to the water-level. We at once decided on imitating this by

preparing a place for it in the aquatic-house; the result was, to use a common garden expression, it grew like a weed, and flowered.

Up to the time of planting there, we had grown it in a pot stood in the tank, but the result was not nearly so good as when planted out in a manner imitating its natural habitat. And this instance strikingly shows the importance of following natural conditions. One great difficulty is to get a correct report of those conditions. I have frequently been told that certain plants grew in nothing but pure sand, but, being rather sceptical about accepting these statements, I found out, by subsequent conversation, that some important particulars had not been taken account of, for my informant went on to say that periodical fires swept the plains, consuming all the vegetation for the time being; but that after a time copious rains followed, and that in a surprisingly short space of time afterwards the plains were again clad with luxuriant vegetation, and wound up by extolling the wonderful fertility of sand. Clearly enough, no account was taken of the ash of the previous vegetation left by the fire in a readily available form. It is needless to say what would have been the result had I tried the sand as advised in an English greenhouse. Mr. Fraser has very truly said, "What we want is careful observers to correctly record the conditions." *F. Ross, Pendell Court.*

HYBRID ROCHEAS.

WE owe to the kindness of Mr. Pynaert, of Ghent, the opportunity of figuring some hybrids (fig. 35), said to be the result of crossing *Rochea coccinea* and *R. jasinea*. They were raised by M. Foucard, of Orleans, and received a First-class Certificate from the National Horticultural Society of France. The colours show all stages between those of the parents, ranging from white, flushed with rose, to deep crimson. The easy culture of these plants, and the beauty of their flowers, render them "plants for the million." They are particularly well suited for window culture. They are of dwarf habit, and may be kept pinched-in to form a close bushy habit. They are easily propagated by cuttings, and, we are assured, flower the same year as they are struck. A well-drained, rich, loamy soil, with a little leaf-mould and sand intermixed, suits them.

CLIVEAS.

CLIVEA of *Imantophyllum* miniature, an introduction from Natal, having produced seedlings which are finer than the type, has already become an acknowledged favourite for conservatory-house decoration; indeed, it is believed that it will in time outrival the free-blooming and beautiful *Vallota purpurea*. Various opinions have been expressed as to whether the name should be spelt as above, or with the letter *h* as a prefix. [According to the latest authorities, *Clivea* is the preferable name. Ed.] As a demonstration of the appropriateness of the longer name, it is only necessary to attempt to break one of the leaves in twain with the hand, which are really, as denoted by the name, tough as "leathern thongs."

Unfortunately for their popularity, these plants have long been considered as stove plants, requiring warmth throughout the winter, though of late years Messrs. Bull, Laing, Williams, and other nurserymen, have rightly placed them amongst greenhouse plants. Messrs. Veitch & Sons, in their last catalogue, enumerate all the species in duplicate under both stove and greenhouse plants. Sullice to say, that seeds raised in this country germinate as freely in a cool greenhouse as those of the Lemon or the Orange; and one-year-old seedlings will withstand the ordinary greenhouse temperature, as will any other greenhouse plant known. Indeed, with the thermometer as low as 30° Fahrenheit, they take no harm whatever.

The large numbers of *clivea* which, in their season of bloom, are distributed in the beds in the Palace at Sydenham, even though but one and two-year-old seedlings, amply exhibit the diversity

of the flowers, and the great endurance of these and the plants. A more objectionable place than the Crystal Palace for maintaining plants in good health does not exist.

Again, its natural season of blooming is given as the month of February, which is no doubt correct, but so amenable to cultivation is the plant that it may be made to flower almost throughout the year. One of the best known plantsmen avers that being in possession of a dozen plants, the grower may have

Like all flowers of tubular shape, Cliveas prove useful for all purposes to which cut flowers may be put in the dwelling and for personal adornment, retaining as they do their form and colour for a long time. The large size of the roots prove that the plants are not difficult to treat in the matter of compost. The soil which suits them best is a rich sandy loam; by rich, I mean that decayed manure, may with advantage be incorporated with it. The roots grow always straight downwards, and it is,

plants are separated into batches for successively blooming, their treatment will necessarily vary considerably.

The new varieties are:—Madame Donner, imperialis, Madame Van Houtte, Mlle. Marie van Houtte, Mlle. Marie Reimera, princeps, insignis, Mrs. John Laing, Lindenii, speciosa, Perfection, superba, and Distinction. The older varieties, which are obtainable at less cost than the above-named novelties, are, *miniata grandiflora* and *robusta*, and all are well deserving of the attention of those who possess a greenhouse. *William Earley.*

FIG. 35.—A GROUP OF HYBRID CLIVEAS. (SEE P. 228.)

1, Mad. Foucart, rose-coloured; 3, M. Buchner, white, with deep rose edges; 4, Mrs. Cannell, white, flushed with rose; 5, Mr. Pützer, cream-coloured, flushed with rose; 6, Mrs. Wynne, carmine.

it in bloom for twelvemonths. The flowers of Cliveas have been much improved during the last few years, but this improvement is in its infancy; much is due to Continental growers in regard to hybridising with a view to obtaining finer blooms, and those who have recently visited Continental exhibitions and nurseries will, of all others, the most fully appreciate this fact. And it is but giving honour where it is really due, when I say that to Continental growers are primarily due, the beautiful seedling varieties under name which we now possess, and to which I shall presently refer.

therefore, desirable to pot the roots firmly and certainly beneath the plant. By this means the roots will not penetrate the soil so rapidly as they would in light soil, but will collect nutriment from every part of the soil. It is difficult to imagine these plants as being anything but evergreen, nevertheless, here under artificial culture, as in their native country, the seasons are beneficially varied by giving abundant root watering during spring, summer, and autumn, and withholding it to a moderate extent during the winter months. It is essential to keep the leaves perfectly clean at all times. Where

NOTICES OF BOOKS.

INDEX OF BRITISH PLANTS.—This is a list of British plants prepared by Mr. R. Turnbull, and published by Messrs. Bell, based on the eighth edition of the *London Catalogue*, and containing all the names therein published, together with the synonyms as found in no fewer than ten of the leading British floras, with references to the figures in *English Botany* and *Bentham's Handbook*, illustrated edition, and the popular names. The accentuation of the Latin names is marked, and the geographical distribution indicated. As a complete list we can recommend it, as likely to be very serviceable from the care with which it has been compiled.

NAMES AND SYNONYMS OF BRITISH PLANTS.

(Bell & Co.)

MR. G. G. WARBURTON has collated the nomenclature of the *London Catalogue*, and of four of our principal British floras. The author adopts the plan of assuming as correct the name which finds acceptance by the whole or the majority of his authorities. We are afraid "critical" botanists will look upon this as a very evasive way of meeting difficulties, for it is quite possible that all five may prove to be wrong, or that the minority may be right. This can only be ascertained by critical study of old facts and investigation of "new lights" as they appear.

SEED TRADE.

MUSTARD.—One of the heads of departments in one of the largest wholesale seed houses in London, informed me recently that the annual sales of Mustard amount to 2000 sacks. This quantity consists almost entirely of what is known as the white or yellow Mustard, and but very little of the brown or black seeded Mustard constitutes a part of this huge bulk. What of white Mustard is English grown, is produced in the counties of Essex, Lincolnshire, and Cambridgeshire, but, considerable bulks are also obtained from California and Holland. The Californian Mustard is not employed for the preparation of the flour of Mustard, as owing to the climate, there is not sufficient pungency in the flavour to make the seeds acceptable for this purpose; but it can be employed for agricultural and garden purposes. The Holland Mustard is employed by the manufacturers.

It is said that the manufacture of Mustard was first understood and extensively practised in the county of Durham, and the finest Durham Mustard was for a long time a trade-mark. The black-seeded Mustard was used in Durham in preference to the white because of being more pungent and of a finer quality; but as it is found extremely difficult to remove the skins entirely, the flour made from the black seeded retains a certain darkness of colour. Much less labour is said to be required to manufacture from the white, and therefore it is now employed to a much greater extent, though sometimes the brown flour is mixed with it. In France and other parts of the Continent, where the art of removing the skins from the seed is not properly known, the black Mustard is still employed, but the flour made from it has a very dark or greyish colour.

In reply to a question as to what portion of the 2000 sacks was employed for sowing in gardens for salading purposes, I was informed about 200 sacks. Mustard has long been much valued as a pungent salad, and for mixing in the bowl, it may, as Messrs. Sutton & Sons say in their useful book on the culture of vegetables, "take the place of Watercress, when the latter is not in command." It is the custom of some to mix the seeds of Mustard and Cress together and sow them; but this is a plan that cannot be commended, for the two plants do not grow at the same pace, and there is nothing gained by mixing the seeds. Brown or white Mustard may be used for gardening purposes; the leaves of the former, as in the case of the flour made from it, is said to be more pungent. The seed of Rape is largely used as a substitute for Mustard for market purposes; but, as Messrs. Sutton & Sons say, "it should be shunned in the garden."

In agricultural districts, Mustard and Rape are both largely employed for cleaning foul ground, and for feeding purposes. It is the practice to sow the seeds in July and August on land that is of a weedy character, and when the crop has grown to a certain height to plough it in before the weeds can produce seeds, or feed it off with sheep. The general practice appeared to be to feed off Rape, but plough in Mustard; though this is not the invariable rule, for in the sheep-producing counties of Sussex Hampshire, and Kent, large quantities are sown for this purpose. Indeed, the sowing of Mustard for agricultural purposes is largely confined to the above-named three counties.

The production of Mustard in the county of Cambridge has been greatly circumscribed by the ravages of a little black beetle that devours the plants. The Lincolnshire crop of seed fell much below the average. The Essex crop was better, but by no means up to the average; but good supplies of seed of fine quality are coming in from California and the Continent, and it is expected prices will rally fairly moderate. R. D.

THE ORCHID HOUSES.

THE EAST INDIAN HOUSE being now well stocked with flower, should have air admitted both by night and day, so as to keep the atmosphere comparatively dry; this will keep the flowers from getting spotted by the moisture. When the sun is strong, the shading should be run down, or the Phalaenopsis flowers will be carried off. Plants of *Aërides*, *Saccobolium* and *Vanda*, which are grown in this house, should be closely examined after being repotted or surfaced, to see that they have no brown scale; should any be found, it should be at once destroyed by aid of soft-soap, applied by a stiff brush or a sponge. The house may now be thoroughly syringed morning and afternoon, more moisture being necessary as the ventilation is increased. Temperature, 65° at night, with a rise of 5° to 10° with sunheat.

Cattleya-house.—Many plants of *Cattleya Triana* will now be in flower. I group all the flowering plants together, and this not only displays the different varieties, but renders it easy to run a thin shade over them when the sun is bright. Plants of *Cattleya Mossie*, late-flowering *Mendelii*, *C. Percivaliana*, *C. Gaskelliana*, &c., may be repotted with safety. The *Brassavolas* do well in this house.

Intermediate House.—Plants of *Cyclopogon*, as they pass out of flower, will require very little water for a month, and even if their bulbs shrivel a trifle, it will do them no harm. *Sobralias* should at once have attention, and any requiring to be turned out should be repotted in one half turfy loam and peat, with an addition of a little silver sand. *Barkerias* must not be allowed to drop their foliage from want of water; these plants are often kept too dry during the winter, and the leaves falling prematurely, the plant is weakened. *Odontoglossum citrosimum* must be kept very dry, or the chances are that it will not flower; no water should now be given unless the back bulbs are shrivelling. *Zygotelium Mackayii* and *Z. crinitum* may be repotted, using peat and sphagnum in equal portions. These are very useful spring flowering plants; they may be grown cool, but do very much better in this house. Here also

Epidendrum prismatocarpum does very much better than when grown in strong heat; very little water should be given now until the flower-spikes are seen to be making their way up the sheaths. Where plants of *Mitonia vexillaria* are throwing up spikes, it would be well to give the plants a dipping in soft-soap and tobacco-water. After doing this, it is a good plan to hang the plants, if possible, on the sides of the stage, head downwards, to drain. Maintain a temperature of 58° at night and 62° by day.

Cool house.—The work to be done here will chiefly consist of watering and damping the house. All the cool growing *Odontoglossums* may be syringed overhead first thing in the morning, but not until the thermometer registers 50°. All parts of the house should be kept damp, and insect pests should be diligently looked for. Temperature, 48° to 50° at night. A. G. Catt, Parkfield, near Worcester.

PLANTS AND THEIR CULTURE.

FORCING HOUSES.—Batches of plants in succession should be put into this structure, and many species may be brought on in others which have been started for other purposes; and much time will be saved if this method is adopted, as hard forcing will in a great measure be avoided. Hyacinths, Tulips, and Narcissus will now force readily, and it is necessary to introduce only a few at a time, and these should be placed near the glass to prevent the drawing of the stems and leaves. Bulbs for late decorative work must be kept cool, and given an abundance of air when the weather is mild. Lilies of the Valley will force readily. I prefer single crowns to clumps for forcing, as blooms come with a good height of stem, and there is plenty of foliage if forcing is not too rapid. The crowns should be put into a brisk bottom-heat, and in cocoa-fibre, and be kept moist. By this means the flower-spikes come in advance of the foliage. Some plants in pots of *Deutzia gracilis* should be ready to again place in heat, and if these have been brought on somewhat in a fruit-house recently started, they will come into bloom readily with a little more warmth. They require abundance of moisture at the roots as they advance towards bloom. Lilac Charles X., and the Persian, may be grown in almost any warm place; even the Mushroom-house will answer for a time if blanched flowers are required; now is a good time to start *Viburnum* and *Staphylea colchica*, *Prunus sinensis flore pleno*, early *Rhododendrons*, *Kalmias*, *Hydrangea paniculata grandiflora*, all require treatment similar to the *Viburnum*, &c. *Azalea indica* may be brought into the forcing-house a few at a time; *A. mollis* will now be found useful, and plants of this should be given a cooler place than the forcing-house as soon as the flowers begin to open. *Spiræas* will force well at this period, if the roots have been grown for forcing purposes. Another lot of Tea scented *Roses* should be brought on, and will require frequent dustings of sulphur to prevent mildew being troublesome. The watering must be done with care till the plants have made free growth, when weak liquid manure should be given them, Callas want abundance of water. *Eupatoriums* need similar treatment to the Callas, and should not be allowed to get dry at the roots. Tuberoses may be potted in succession, and placed in bottom-heat, and treated as previously advised, withholding water for a time until growth commences. A few pots of forced *Solomon's Seal* should not be omitted. The useful *Dielstra spectabilis* may also be brought on slowly in a light pit or house, and when they are in active growth moisture at the root should not fail.

Greenhouse and Cool Pits.—The greenhouse should now have more air, and the plants more liberal waterings as the sun gets stronger. When artificial heat is used to counteract the effects of the cold nights usually experienced in March, many of the New Holland plants, *Ericas*, and *Epacris* will be in bloom; these should never be allowed to get dry at the root. The early blooming *Epacris* will soon be past their best, when they should be cut back, watering sparingly till new growth commences; they may be placed in an intermediate-house, or at the warmest corner of the greenhouse, free from cold draughts, and repotted as soon as they have made a good start, giving a shift only when necessary. The soft-wooded Heaths, like *E. hibernica* and *E. Wilmoreana*, require similar treatment to the *Epacris*, and when repotted, only good peat and clear silver-sand should be used for them, giving clean materials

for drainage, and making the compost very firm. The later blooming *Ericas*, of which *E. Cavendishiana* is an example, must now be attended to closely, as any neglect in the watering will soon cause the plants injury. This work should always be attended to by one person, who will be able to judge of the requirements of the different plants. Plants of *Epacris Eclipse* and *E. miniata* should be fastened with a few ties before the flowers open, just to keep the shoots in trim order. *Chorozemas* need similar attention, as well as plenty of water, and to be occasionally turned round, so as to keep them in nice shape.

Pimeleas will now be growing freely, and should, when in good condition, be assisted with a mild fertiliser, and be damped over with the syringe on favourable occasions, so as to check inroads of red-spider. *Polygalas*, though not so much grown as once they were, are pretty plants, easily grown, and will now require sunny positions and attention as regards watering; *Keinedyas* also require water in abundance if well-rooted, and a few ties where necessary. Should insect pests, as is often the case, be troublesome, syringing with petroleum emulsion should be resorted to. We use Bentley's soluble petroleum for this purpose, for wealy bug and scale insects, and find it much safer than ordinary petroleum and water, which is difficult to keep properly mixed, whilst being made use of. *Acacias* will soon be in full bloom, and it scale be found on the plants, the latter should be syringed, before the blooms expand, with an insecticide. These plants will take more water after this date, and occasionally manure-water. *Boronia*s should be put into a light place, so as to show their flowers to advantage, and carefully watered—but not too freely.

Aphelaxis, *Leschenaultias*, *Acrophyllums*, *Darwinias*, and *Tetrathecas* need similar attention, keeping them as near to the light as possible and unshaded at this season. *Statice*s will have commenced to grow freely, and will give a better return if at once repotted if they are in a vigorous condition. These should get a large proportion of good yellow fibrous loam, with a few lumps of charcoal, and a small quantity of decayed manure and bone-dust, with half-inch bones placed over the drainage. After potting, place the plants for a time in a temperature warmer by a few degrees than the greenhouse. If mildew should attack them, dust with flower-of-sulphur. These are serviceable plants for autumn decoration of the conservatory, as they remain a long time in bloom; but to get strong flower-spikes the plants require to be well grown. *Genistas* will take abundance of water, with weak manure water now and then if they are not bound. Young stock of these plants and of *Statice profusa* and *S. Halfordii* should be propagated at this date from strong cuttings. G. Wythes, Syon House.

THE FLOWER GARDEN.

ORDINARY BEDDING PLANTS.—Autumn-struck cuttings of *Helianthemums* for bedding purposes should now be potted off, and placed in any of the houses or pits where a little heat is at command. A slight syringing overhead is all the moisture they will require for a few days, if the soil was in a proper state of moisture at the time of potting.

Propagating.—Proceed with the propagation of carpet bedding and all other plants required for beds, having previously prepared a hot-bed or house with a brisk bottom-heat for their reception. Carnation roots should be divided, potted, and placed in gentle heat; they will make nice plants by bedding-out time, and unless they are prepared in this way, would rarely attain perfection in the more northern parts. *Eulalia japonica variegata* and *E. zebrina*, two useful subjects in the sub-tropical garden, should now also be divided, and placed in the same temperature.

Seeds to be sown in addition to those previously mentioned are:—*Ferdinanda*, *Eulalias*, *Masses*, *Melanthus major*, *Champanee Casabone* and *lanceolata*, *Cineraria maritima*, *Solanum giganteum*, *S. robustum*, *S. marginatum*, *S. praeacanthum*, and *S. Warszewiczii*, *Viandias*, *Echeveria metallica* and *E. glauca*, *Eucalyptus*, *Lobelias*, and *Pyrethrums*. Intermediate *Stocks* sown now, and potted off when ready, will be fit to turn out at the end of April, and give a nice succession of bloom to the Ten-week varieties.

Weeds and Moss on Lawns.—At this season, unless

on very clean lawns, Daisies, Plaintains, Docks, Dandelions, spring up and give the lawn an unsightly appearance, and the present is the best time to uproot them. Docks and Dandelions if cut off about an inch below the surface, and the remaining portion of the root covered with common salt, will invariably complete their destruction. Moss on lawns may be kept down in a great measure by frequent and close mowing by the lawn-mower throughout the year, and regular sweeping with a birch or heath-broom. Where moss does exist, the turf should receive a thorough rough raking with a small iron rake, to remove most of the moss, and then be well swept afterwards. A dressing of well-slaked lime or horseashes then strewn over it, or what is preferable, a dressing of finely sifted rich loamy soil, will be found most beneficial to the growth of the grass. Both after the removal of moss and the weeds, the dressing of soil should be made with an addition of a thin sowing of grass seed raked in and then well rolled, will ensure a thorough renovation. *D. C. Powell, Powderham, Exeter.*

FRUITS UNDER GLASS.

LATE winter berries ready for starting should have their outer borders covered up to protect from snow water, and the inside borders should have the inert and dry soil removed, to be replaced by a moderate top-dressing of sound loam and bone meal. Syringe the rows backwards and forwards twice daily. Muscats, Lady Downes, and other late kinds, should be started at the end of the month, in order to have them well ripe before the summer sun loses its power.

Any renovation of border omitted in September and October may yet be done just as the buds begin to swell, and if the roots be carefully forked-out of the exhausted soil, and replaced in new suitable soil, made firm and solid, it is really astonishing how soon real beneficial results can be realised.

Peaches and Nectarines.—In the earliest house proceed with disbanding by degrees, removing forrigh and under-meath buds first. Do not overlook the fact that leaf growth increases activity in the roots; on the other hand carry the mind forward regarding an ultimate crowding of shoots, and endeavour to strike the balance, the fruits which are safely set will now be taking the lead, and others should be at once removed, to prevent waste of power. Bring the syringe into use twice daily, and further increase the daily temperature to 70° or 80° with sunshine. Ventilate as before advised, and keep a sharp look out for aphid. A few pufts of tobacco-powder will keep all safe if done soon enough, otherwise fumigating must be resorted to, but before doing this make certain that the foliage is quite dry. The second house, if in flower, must have the help of the camel's hair brush or rabbit's tail for artificially fertilising the flowers. Trees in the late houses are all forward, and should have the number of their buds reduced. The mild weather is responsible for this precocity.

Orchard houses, with trees in pots or otherwise, should be dealt with, and plants must be housed, having first undergone a dressing of Gishurst. Arrange the Plums and Cherries at the end of freest ventilation.

Figs will require some thinning; the deformed and misplaced fruit should be pulled off. The best fruit is found on extension branches. Stopping the shoots hastens the first crop at four leaves, but unless back shoots are required, the less stopping the better. Fly the syringe vigorously twice daily, but beware of steam arising from hot pipes. With the increased light increase the temperature to 60° at night, and 70° or more by day, using abundance of tepid liquid manure. Exercise extra vigilance for white scale, which establishes itself upon and spoils the young fruit.

Melons will, under favourable circumstances, be well up their sticks. Keep a bottom-heat of 80°, and a night top heat of 70°, rising to 85° by day, with abundance of moisture, but take precautions to give ample ventilation in order to build up leaves of stout substance, able to stand against the weather of March, otherwise the foliage will die and burn, becoming an easy prey to red spider. If Melons be planted thinly and grown on the extension system, they will produce fruit more in succession, but on the whole I prefer one plant for three or four fruit, sowing a few seeds fortnightly.

Cucumbers.—Old plants have improved in appearance with the mild firing necessary of late, and are bearing freely, advantage being taken to gradually withdraw as much old wood as possible; they too love extension, and one plant will occupy a whole pit, and give good returns. Telegraph remains my favourite variety. Attend to and prepare young plants for succession.

Strawberry-house.—The early pots are on the point of colouring their fruit, and should be given a nice warm moderately airy shift, to finish and improve the flavour; give warm diluted liquid manure at every watering till colour shows, using clear water afterwards. Successional batches are treated as stated previously, daily using the camel's-hair brush for setting purposes, thin the fruit, letting plants in 5-inch pots bear six fruits each; use the syringe vigorously to keep insects clear, and introduce fresh batches according to demand. *Wm. Crump, Madresfield Court, Malvern.*

THE HARDY FRUIT GARDEN.

DURING the past fortnight we have experienced frosts varying from 4° to 14°, and cold north and east winds, the effects of which will be beneficial to all kinds of fruit, retarding the opening of the buds. The frosts caused much ground work to be suspended, and gave an opportunity to wheel mulchings to places where it was needed. The amount of mulching given to any tree will depend upon its vigour, the quality and the depth of the soil, as well as situation. Those whose gardens are level have no idea of the disadvantages those are under who have gardens on hill-sides; for not only is the working of the latter garden much increased, but the drying influence of wind and the rapid exit of water are much more felt. We mulch almost everything, and by doing so the ground is kept moist, and when rain-storms come most of it is retained by the soil instead of running off, as it would do if no mulching were there. Trees growing vigorously and in good soil should only be mulched with half-decayed straw to the depth of 3 inches, this simply keeping the soil moist, and free from weeds; but trees growing in shallow or poor soils should have a heavier mulching, and farmyard manure, if it be procurable. Mulchings keep many of the roots in the upper stratum of soil, and any which are found to have gone into the lower stratum, should be lifted, and the roots laid higher. The condition of the roots is of more importance than that of the branches, for if the former are unhealthy, no attention bestowed on the latter will do any good. At the same time, the practice of starving trees into fruit bearing by cutting and mutilating two-thirds of their roots close to the stems, must be avoided, and the system of ringing the bark of branches and stems, are practices I strongly condemn. Much the best plan to adopt is to take part of the fruit borders annually and lift, and, if necessary, root-prime half round each tree, leaving the other half till the following or second season. With small trees commence about 20 inches from the centre of tree, and larger ones 3 feet, digging down below the roots, and cutting away any roots which may have passed directly downwards, prising the roots carefully at the ends, before replacing them in the fresh soil. If at all exposed to strong winds, they must be securely tied to stakes, driving them in the opposite side to where the soil has been moved.

Grafting should be commenced, the more forward stocks and scions having precedence; and to avoid the necessity of having to renew the clay from grafts, bind it round with live moss at the time of grafting. Cuttings of Currants and Gooseberries, if the work has been delayed, may now be put in. The cuttings may be of any length, and inserted from 4 to 6 inches in the soil, and on Gooseberry and red and white Currants; from this part all the buds should be removed to prevent the formation of suckers or ground shoots, also rub off the eyes for a few inches above the ground-line to confine the bushes to stems only, black Currants excepted. Pinus in bud are now very tempting morsels to the ballfinches, and, being trees not easily protected when once the birds get a taste of the buds, their appetite seems to become insatiable. If these birds are very numerous, powder and shot must be employed to lessen their numbers. *A. Evans, Lythe Hill, Haslemere.*

THE KITCHEN GARDEN.

Onions.—Take advantage of the first favourable occasion to get in the main crop of Onions. If the ground has been properly prepared, there will be but little difficulty now in making up good beds; and for this important crop no pains should be spared in getting the soil in good workable condition. It is essential that the ground be firm, especially if the soil is light and shallow; but if the soil be heavy and stubborn, some amount of judgment is required, and in some cases the less the ground is trodden upon the better. The bed should be slightly forked up early on a bright morning, so as to dry the soil before it is made firm, then sow the seed thinly in shallow drills from 10 to 12 inches apart. If maggot be troublesome, give a thorough dressing of soot, and repeat several times during the early part of the season when damp, after the plants are up, after covering the seed with a rake, it may then be rolled, but if trod in, a slight rake over will suffice. Heavy stubborn soil should be marked out in 4 feet beds, raised several inches above the level, with 12-inch alleys between. The seed should be covered over by hand with some fine soil and burnt wood ash, smoothing the surface with the back of a spade. We shall limit ourselves to three varieties, viz., Veitch's Main Crop, Bedfordshire Champion, and James's Long Keeping.

Shallots and Garlic should now be planted, pressing the bulbs into the soil sufficiently deep to hold them fast; plant on well enriched beds 8 inches apart in the rows, the rows being 10 inches apart.

Carees.—A good bed of the Early Nantes, or Short Horn, should now be made on a warm border, to follow those sown in frames; these may be sown rather closer than the main crop; the seed of the latter should remain in the packet for some time yet. Avoid sowing when the ground is sticky.

Parsley may now be sown on well-prepared beds, not too rich, and made firm, covering the seed with burnt garden refuse if obtainable.

Spinach.—A good bed should now be sown to follow the winter crop. Rich soil deeply dug suits this crop well; poor soils lead to early seeding. Soot is a capital fertilizer of this crop.

Wallishes, Leeks, Lettuce, Brussel Sprouts, Cauliflowers, especially the Walcheren—a never-failing variety, being alike good in dry and wet weather—may be sown on well-sheltered borders; but in cold districts, Brussel Sprouts should always be forwarded in heat, so as to get good-established plants early in the season.

Chabiches.—New plantations, if required, should be made by dividing the old stools, and replanting on well-trenched and heavily-manured soil in a cool moist position. Do not gather the first season's yield.

Herbs.—Several of these will now need attention in the way of dividing and replanting. The whole border should be thoroughly gone over, the various kinds increased as may be required. Sage roots more freely from slips planted and trod in very finely in April. Mint, although, as a rule, increased by roots being placed in shallow trenches, is much better done from young sprigs; these should be pulled up when 3 to 6 inches high, dibbled in rows 12 inches apart and 8 inches in the rows, on well-prepared beds, part of which should be in a cool position; increased in this way, it is astonishing what fine plants each make by the middle of June.

Onions and Leeks.—If large Onions and Leeks are required early, a box of each should be sown and forwarded in heat, and these bulbs, with care, will by the month of September have grown to a large size. Onions and Leeks transplant well, but anything likely to check the young plants must be avoided.

Tomatos for planting outside should now receive attention, it being essential that the plant be in a very forward state when put out. There are so many different varieties grown that selection must be left to individuals; Orange-field and Laxton's Open Air are both good. Sow the seed thinly in pans or pots of sandy soil, and place in warmth; and when the plants are large enough they should be transferred to small pots, putting two plants in each pot. Keep the plants growing, and report them when necessary. Our heaviest crop last year was gathered from plants which had set much of their fruit when planted out. *H. Markham, Moreworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	FEB. 24.	Lilies, Roses, and Greenhouse Plants, at Protheroe & Morris' Rooms.
TUESDAY,	FEB. 25.	Orchids in Flower at Protheroe & Morris' Rooms. Roses, Greenhouse Plants, &c., at the City Auction Rooms, at Protheroe & Morris' Rooms.
WEDNESDAY,	FEB. 26.	Roses, Fruit Trees, and Greenhouse Plants from Ghent, Border Plants, Shrubs, &c., at Stevens' Rooms. Japanese Lilies, Roses, and Plants, in pots, at Protheroe & Morris' Rooms.
THURSDAY,	FEB. 27.	10,000 Liliun auratum and other Bulbs from Japan, Pearl Tuberoses, Tigridias, &c., at Stevens' Rooms.
FRIDAY,	FEB. 28.	Established and Imported Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40° 2.

At a recent meeting of the Academy of Sciences of Paris, M. AIMÉ GIRARD alluded to a variety of Potato but little known in France, and still less here, but which is, nevertheless, remarkable for its yield of tubers, and for the richness of these in starch. While, says M. GIRARD, the average yield of tubers in France does not exceed 7500 kilogrammes (say 147 cwt.) to the hectare, a hectare being 2·4 acres, and a yield of 15,000 or 18,000 kilos, is considered excellent, the variety known as Richter's Imperator may, under certain conditions, yield as much as 35,000 to 40,000 kilos, per hectare of tubers with more than 20 per cent. of dry starch.

M. GIRARD first tried the variety for three years on a small scale, but in 1888 and 1889 he grew it on a large scale, but still with the same general results, so that, in 1889, he obtained 39,000 kilos, of tubers per hectare, with a proportion of 20·4 per cent. of starch, representing consequently 7956 kilos, of dry starch, that is to say a weight of dry starch per hectare superior to the general average weight of the tubers themselves in France. [The italics are ours, Ed.]

Moreover, M. GIRARD confided tubers to forty growers in different parts of France. From all these reports were received but ten were eliminated, as not having complied with the conditions, and thirty-three reports were selected as representative of the ordinary field culture. The general result has been, that yields of 32,000 to 44,000 kilos, per hectare, with a proportion of 20·4 to 24·2

per cent. of dry starch, or a general average of 36,000 kilos, and of 7900 kilos, of dry starch have been obtained. Those cultivators, on the other hand, who lifted their tubers in September, or who planted out sets, and not entire tubers, grew them at too great a distance apart, applied an insufficient quantity of manure, and so on, only obtained a yield of from 13,300 kilos, as a minimum, to 30,000 kilos, as maximum. A graphic diagram is added to M. GIRARD'S communication, which show the facts very clearly.

The average yield per hectare is 7500 kilos., the yield in the Department of "Hautes Alpes," the most favoured in this respect being 11,700 kilos. The value of this variety for alcohol-making is thus, from the large percentage of starch which is capable of conversion into alcohol, so great that Richter's Imperator will not commend itself to the teetotallers. However, there are other uses for spirit than the manufacture of Potato brandy, and there is no doubt that M. GIRARD'S investigations will prove of great economic importance. It may be added that M. DEHERAIN, the Director of the Agricultural Station at Grignon, has made experiments with Richter's Imperator in comparison with two other varieties similarly treated. Mr. DEHERAIN'S observations substantially confirm those of M. GIRARD, although, on the whole, they are rather less favourable than those of M. GIRARD'S correspondents. In VILMORIN'S *Plantes Potagères*, among the German varieties, we find this description of Richter's Imperator:—"Tubers large, oblong, slightly flattened, but, nevertheless rather thick, of oval form, slightly notched, skin pale yellow, with a salmon tint; flesh almost white; shoots purple; haulm robust, erect, stiff; leaves rather distant, with rounded folded leaflets; flowers lilac. This variety is *demi tardive*, and somewhat resembles the English variety, Paterson's Victoria, but the tubers are larger and less regular.

We publish in another column a report of the proceedings against

FREDERICK WISE for obtaining goods under false pretences, and the case is not without its lesson. Perhaps of all trades, the horticultural trade is more open to such fraud than any other, and especially is this so in the case of head gardeners who send their produce to market, and who cannot be expected to have that knowledge of persons connected with the market which is possessed by others. That such frauds have been practised for a considerable time is well known, and this too notwithstanding the efforts on the part of the market authorities to prevent them. It is not always, however, that members of the trade who have been defrauded are found willing to devote the necessary time to prosecuting, to say nothing of the expense to which they would inevitably be put. We are glad, therefore, to see that the three prosecutors in the case (two of whom are head gardeners) have exhibited sufficient public spirit to give up their time and put themselves to a considerable amount of trouble and expense, in addition to being sufferers by the loss of their goods, in order to make an example of the man by whom they were defrauded. It is true that the prosecution was taken up by the Nursery and Seed Trade Association, but inasmuch as we understand there are no funds in that Association available for defraying the costs of prosecutions, it follows that the costs must be borne by individuals. A year ago the Association took up a prosecution for adulteration of Clover seed, which resulted in the infliction of the full fine,

and in that case we believe the costs were defrayed by a few individuals. These facts taken in connection with the natural reluctance on the part of members of the trade to prosecute, point to necessity for the existence of a fund for the purpose of defraying the costs of such prosecutions; otherwise the trade is left at the mercy of fraudulent persons. We commend this to the attention of the trade, for what is every one's business is no one's business; but if it were the duty of such an Association to undertake, at the expense of the Association, such prosecutions, we have no hesitation in saying that the trade would benefit thereby. It would, indeed, be hard if the costs of the present prosecution should fall on the prosecutors themselves. They have given their time to it, and this is all that should be expected of them.

ÆRIDES AUGUSTIANUM.—This new species (fig. 36), was described by Mr. Rolfe at p. 9 of our current volume. It is allied to *A. Roeheloni*, but differs in its longer, stouter, nearly straight spur. It was discovered in the Philippine Islands by M. AUGUSTE LINDEN, to whom it is dedicated, and is offered by the Horticulture Internationale. The flowers are of a light rosy colour, each from 1 to 1½ inch long.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—It will be of great interest to a large circle to know that Mr. HARRY VEITCH, the Treasurer of the Institution, will preside at the annual dinner on Thursday, June 12 next.

THE CARNATION AND PICOTEE UNION.—Mr. E. S. DODWELL has just issued the fifth annual report, which consists of a closely printed pamphlet of fifty-six pages. There are now about 350 subscribers to the Union, 104 having joined during the past year. In the year just past, the subscriptions amounted to £155 9s. In addition to the usual report, &c., there are given the names of the flowers shown in all the competing stands at the last exhibition, the proceedings at the luncheon, the annual general meeting, and—what is, perhaps, the most valuable—reports from leading growers as to the evidence of the season, and the good flowers grown or seen by them. Under this heading, interesting notes are supplied.

PRESTON AND FULWOOD HORTICULTURAL SOCIETY.—At a meeting of this Society on Saturday last, Mr. WATERS, who is leaving the district to take charge of the gardens at Hopwood Hall, near Manchester, was presented with a very handsome timepiece by the members as a mark of the respect and esteem in which he was held; Mr. CHAS. PARKER made the presentation in suitable terms. Mr. ROBERTS, and others briefly spoke on the matter, and the meeting cordially wished Mr. WATERS a prosperous career in his new sphere. Mr. WATERS acknowledged the kindness he had always received from the members, and spoke of the great good the Society was doing in a horticultural sense.

TELEGRAPH MONEY ORDERS.—It is announced from the Post Office that on and after the 1st of March, 1890, money may be transmitted by telegraph money order between all head and branch offices in the United Kingdom at which telegraph and money order business is transacted, under the following conditions:—The commission will be: for sums not exceeding £1, 1d.; for sums above £1 and not exceeding £2, 6s.; for sums above £2 and not exceeding £4, 8d.; for sums above £4 and not exceeding £7, 10d.; for sums above £7 and not exceeding £10, 1s. In addition to the commission, a charge will be made at the ordinary inland rate for the official telegram authorising payment at the office of payment, and for the repetition thereof, the minimum being 9d. The telegraph charges only cover the cost of transmitting the official telegram of advice to the

postmaster of the office of payment and its repetition. Any telegraphic communication which the remitter may wish to despatch to the payee must be paid for at the ordinary inland rate, the minimum being 6*l.* No single telegraph money order can be issued for a greater amount than £10. A receipt for the amount of the order will be handed to the remitter. Any person expecting a remittance by telegraph must furnish satisfactory evidence that he himself is the person entitled to receive the money. He, or some one on his behalf, must attend at the office to obtain payment. Should repayment of a telegraph money order be required, the remitter must make application to the Controller, Money Order Office, General Post Office, London, or to the Accountant, General Post Office, Edinburgh, or Dublin, according to whether the order was remitted from an office in England and Wales, Scotland, or Ireland. He must enclose the official receipt with his application. A new order will then be issued, less the ordinary commission, payable at any money order office named for the purpose. In other respects, telegraph money orders will be subject to the regulations which govern the transmission of ordinary money orders.

AUSTRALIAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—The second meeting of this body commenced at Melbourne on January 7, under the presidency of Baron von MUELLER. Australian science was largely represented—indeed, to a much larger extent than many Europeans would have considered possible. The Baron's introductory address occupies some six columns of the Melbourne *Ages*, and included a review of the progress of science in Australia that was eminently satisfactory. The conservation of forests was advocated, and allusion made to the Australian Alps, to which an excursion of four days was devoted.

PARIS HORTICULTURAL CONGRESS, 1890.—This will be held at the apartments of the National Horticultural Society of Paris, 81, Rue de Grenelle, at the time of the General Horticultural Exhibition, May 21 to 26 next. Among the subjects for discussion are the following:—The permanence or otherwise of varieties; Enquiry as to whether, in order to obtain striped flowers, it is essential to begin with white flowers; Railway rates; Chemical manures, their use in horticulture; Customs dues; Destruction of garden pests.

NATIONAL FOOTPATH PRESERVATION SOCIETY.—We are glad to see that this Society is making satisfactory progress. The chief officers, it appears, are new proprietors, who endeavour to destroy rights of way, which their predecessors had not dreamed of treating otherwise than as public property. Very often this arises from sheer ignorance. Many disputes might be equitably arranged by this Society, which is careful of the rights of proprietors, as well as of the public.

SELF-HELP EMIGRATION SOCIETY.—This Society gives assistance to suitable persons desirous of emigrating to the British Colonies, by aiding them on the voyage, and facilitating the search for employment on arrival. Each intending emigrant contributes towards the expenses, the Society supplying the balance, and employing agents in Canada to watch over the interests of the emigrants on their arrival, and until they are settled. The Society is supported by public subscriptions, which fall short of what is demanded. The Treasurer is E. BARCLAY, Esq., 54, Lombard Street.

BOTANIC GARDENS, ETC.—The following appointments have been made recently:—

Berlin.—Dr. FAX, formerly of Breslau, has been appointed "Custos" of the Botanic Garden, Berlin. Dr. NIEBOENZ, also of Breslau, has been appointed assistant in the Berlin Botanic Garden.

Graz.—Dr. MOLISCH has been appointed Professor of Botany in the Technical High School.

Montpellier.—Dr. GRANEL has been appointed Professor of Botany, in the room of Professor PLANCHON; and Dr. COCHNET becomes Professor of Botany in the School of Pharmacy.

St. Petersburg.—Dr. BOGOUIN has been appointed Professor in the University, in the place of Professor FAMINTZIN.

Charkow.—Dr. PALLADIN has been called to the Professorship of Botany in the University.

New York.—Dr. REISCH, well known for his collections in tropical South America has assumed the Professorship of Botany in the New York College of Pharmacy.

Quito.—The Professorship of Botany and Directorship of the Botanic Garden, so long held by our correspondent, the late Dr. JAMESON, has been conferred on Dr. LAGERHEIM.

Oxford.—Mr. DRUCE has been appointed sub-caretor of the Fielding Herbarium.

"ILLUSTRATION HORTICOLE."—The number for December 25, only recently received, contains a full illustrated account of the "Horticulture Internationale," the important establishment in Brussels directed by M. LUCIEN LINDEN, and of which we have already given an account in our columns.

"DIE NATURLICHEN FAMILIEN."—This valuable publication, issued under the auspices of Professors ENGLER and PRANTL, has now reached as far as the Composites, which are described by Professor HOFFMANN, of Berlin. The numerous woodcuts are of great assistance.

PALERMO BOTANIC GARDEN.—We have received the *Leder Scimmia* from this establishment, the extent of which may be judged from the fact that it consists of 38 quarto pages of three columns each.

STEPHENS' "BOOK OF THE FARM" DIVISION IV.—The fourth divisional volume, just published, completes the spring work, and carries the reader through the greater portion of the operations of summer. It is practically a new volume, most of the chapters having been entirely rewritten, and the others very thoroughly revised. The volume opens with "Potato Planting," which is described very fully; the tilling, cleaning, and manuring of land for Potatoes being exhaustively dealt with. A specially interesting section in this chapter is that describing the process of raising new varieties of Potatoes from seed. The summer culture of cereal crops is completed by a short section describing the process of raising new varieties of grain by "Cross-Fertilisation." New chapters have been introduced on the insect and fungoid attacks on crops and stock. The preparing of pastures for stock, and the treatment of sheep, cattle, and horses in summer, are practically and fully discussed. The volume closes with an exhaustive treatise on "Dairy Work." This consists wholly of new matter, and occupies about one-fifth of the entire volume.

AN EXAMPLE NOT TO BE FOLLOWED.—We take the following from a French paper:—"Madame L., dog's tailor, has arrived at Nice with a large assortment of the newest 'toilettes' for dogs. She will exhibit these articles at the general Horticultural Exhibition! at Cannes on the 23-27th inst."

NOMENCLATURE.—Our contemporary, *L'Journal*, says that a Begonia, known in France as *Le Mahonti*, is identical with that known as Moonlight, which French readers are told to pronounce as if written "Mounlaite."

JOHN STUART MILL AS A BOTANIST.—An interesting glimpse of a distinguished man is to be found in an earlier chapter of Mr. Tozer's voyages, which one may confidently recommend as a very pleasant hook of scholarly travels. On his first two voyages among the *Egean Islands*, Mr. Tozer had for his dragoman Alexandros Anemogaunes, who on various occasions had accompanied well-known travellers in Greece, such as G. F. Bowen, W. G.

Clark of Cambridge, John Stuart Mill, Dean Stanley, and others. It is of Mill that Mr. Tozer tells us an interesting little fact. He says: "In the midst of the ruins [of the Temple of Apollo on Delos] Anemones of various colours—white, pink, and lilac—were growing, and I dug up some fine Narcissus roots to transplant to England. For this proceeding I had good authority. Our servant informed me that J. S. Mill, when he travelled with him in the Peloponnese, besides drying flowers, had an extra baggage mule in his train for carrying plants and roots." Mill, as is well known, was a confirmed botanist, and learnt in the methodical classification of flowers what he taught in logic. One of his biographers has related how he met "the (at that time) parliamentary logician, with his trousers turned up out of the mud, and armed with the insignia of his craft, busily occupied in the search after a marsh-loving rarity in a typical spongy wood on the clay to the north of London." We may add that Mr. Mill's herbarium is at Kew.

BLACK WALNUT.—It is stated in *Garden and Forest* that one of the largest specimens of Black Walnut probably ever sent to an eastern market in the log may now be seen in the timber yard of Messrs. JONSSON BROS., 385, Albany Street, Boston. The tree which produced it grew near the falls of the Kenawab, in West Virginia, on the line of the Chesapeake and Ohio Railroad. The trunk, which measured 64 feet to the first branches, has been cut into five lengths; the butt log, the centre of which is hollow from decay, measures at the base 8½ feet across. The diameter of the log, cut 25 feet from the ground, is 4 feet 2 inches, and that 50 feet from the ground has a diameter of 3 feet 11 inches in one direction, and 3 feet in the other. The upper end of the fifth log, at a point 61 feet from the ground, where the trunk had been a good deal flattened, measures 4 feet 1 inch through one diameter, and 2 feet 9 inches through the other. These measurements are all made inside the bark. A thousand feet of lumber have been cut from the main branches, and the five trunk logs are estimated to contain 10,000 feet. The wood in the butt log outside the central cavity is beautifully curled and marked. A superficial examination of the annual layers of growth shows that this great tree has grown on the whole with wonderful rapidity, and that it is probably less than 300 years old.

SEEDLING SUGAR CANES.—The last number of *Garden, Field, and Forest* (Demerara), contains an interesting account of six seedling varieties raised at the Dodd's Botanical Station, Barbados. These were selected from a lot of natural self-sown seedlings, discovered in Barbados some two years since. They are spoken of as very promising. The seeds take about seven days to germinate.

ILLUSTRATIONS OF BRITISH FUNGI.—Dr. COOKE continues his valuable series of illustrations of British fungi. No fewer than 1146 coloured plates have already been given. The text is given in the current numbers of *Grevillea*.

"BOTANICAL MAGAZINE."—The February number contains coloured figures of the following plants:—

Podophylla pleanthum, t. 7098.—See *Gardeners' Chronicle*, 1889, Sept. 14, p. 299, Kew.

Cottonia macrostachya, t. 7099.—A curious Vanda-like Orchid, with loosely-panicked flowers. Each flower measures about 1 inch in the longest diameter. The segments are oblong, yellow, striped with red; the lip is in form and colouring like that of *Ophrys arantaria*. It is a native of peninsular India and Ceylon. Kew.

Drosera cistiflora, t. 7100.—A very striking and large-flowered *Drosera*, with scarlet petals, on which repose the five white styles, each fringed at the apex. The leaves are linear, and studded with glandular hairs. It is a native of the Cape, and flowered at Kew.

Chironia palustris, t. 7101.—A perennial, with the leaves oblong-linear, the lower ones tufted, the upper opposite; flowers pale pink, with twisted yellow anthers. Native of the Cape of Good Hope.

Cypripedium Rothschildianum, t. 7102.—A superb species from New Guinea, and very close to, if not identical with, *C. Elliottianum* from the Philippines. The present plant has an ovate-lanceolate upper sepal, yellowish, with reddish-brown stripes, long linear petals, warty, and coarsely setose; a spoon-shaped lip, the pouch gibbous and decurved, of a brownish colour flushed with rose. The staminode is very peculiar, being linear terete, densely hairy below, sharply curved downwards in the middle. With reference to this species, the editor follows a practice we do not remember to have seen adopted before, viz., that of adopting a name given in an advertisement without any description. An advertisement is so purely a commercial matter, that we should hardly think it desirable to take any notice of a name so given in a botanical publication.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—This Society has held two meetings during the last month. On January 28 a paper on "Ontonoglossums" was read by Mr. H. BROWN, which was much appreciated. On February 11, Mr. W. M. ALEXANDER submitted a paper on the "Cultivation of Soils for Garden Crops," which was followed by a discussion. The members are steadily on the increase.

HORTICULTURAL CLUB.—The annual dinner took place on Tuesday evening, February 11th, at the Club-room (Hotel Windsor), when there was a very full attendance. The chair was occupied by the Chairman of the Club, Mr. JONES LEE, and there were present Sir John T. D. Lilwelyn, Bart.; Dr. Hogg, the Rev. W. Wilks, Rev. F. H. Gall, Messrs. T. B. Haywood, P. Crowley, Harry J. Veitch, J. H. Veitch, George Deal, George Paul, T. W. Girdlestone, H. J. Pearson, W. Bull, H. Turner, Lynch White, Baker, J. J. Cousins, C. T. Drury, George Bunyard, Arnold Moss, and the Secretary. Vocal and instrumental music was given during the evening, under the arrangement of Mr. George Bunyard, and the meeting was a very successful one, and many good wishes were expressed for the prosperity of the Club.

THE IVIES, WINCHMORE HILL.—We notice that this place, with its well-kept and tidy garden, of which we gave an illustration in our issue for June 22, 1889, p. 779, is in the market.

SHOW FIXTURES.—The Crystal Palace Company announce a series of flower shows for 1890. The spring show takes place on Saturday, March 29, and the summer show on May 10. The National Rose Society's exhibition will be held at the Palace on July 5. The fruit show and National Dahlia Society's show is fixed for September 5 and 6; the autumn fruit show October 9, 10, and 11; and, lastly, on November 7 and 8, a Chrysanthemum show will take place. The first of the Royal Aquarium flower shows has been announced for March 12 and 13. The Royal Horticultural Society of Jersey will hold shows on March 12, June 25, August 29, October 22, and November 11 and 12. The annual exhibitions of the Devon and Exeter Horticultural Society will take place in Exeter on August 22 and November 7. The Paisley Horticultural Society's shows are fixed for March 27 and 28, and September 4 and 5.

LINNEAN SOCIETY.—At a meeting held on February 6, Mr. CARUTHERS, F.R.S., President, in the chair, Professor STEWART, referring to an exhibition at a previous meeting, communicated some interesting observations on the habits of certain seaweed-covered crabs. He also made some remarks on the "pitchers" of *Nepenthes Mastersiana*, upon which criticism was offered by Mr. THOMAS CHRISTY, Professor HOWES, and Mr. J. MURRAY. Professor G. S. BOULGER exhibited a series of original water-

colour drawings of animals and plants of the Falkland Islands. Mr. W. H. BEZAN exhibited some forms new to Britain of plants from Shetland. Mr. C. B. CLARKE, F.R.S., then read a paper on the stamens and setae of Scirpæe, illustrated by diagrams, which elicited a detailed criticism from Mr. J. G. BAKER, to which Mr. CLARKE replied. A paper was then read by Mr. B. D. JACKSON, which had been communicated by the late Mr. JOHN BALT on the Flora of Patagonia, prefaced by some feeling remarks by the President on the loss which the Society had sustained through the recent death of this able botanist.

GHEENT CHAMBRE SYNDICALE.—The first meeting of this year was held on Monday, the 10th inst., and was a very successful gathering. There was a good show of Orchids, and awards were made as follows:—First-class Certificates: to *Asparagus medius*, from Mr. L. Desmet-Davivier; to *Lycaste species*, from Mr. A. Van Imeschot; to *Lælia anceps* var. *Lindeni*, *Odontoglossum malus*, *Wilkenium albens*, *Oncidium incurvum album*, *Odontoglossum Alexandræ Trianae* var., and *Cypripedium Elliottianum*, from Mr. J. Hye-Leyssen; to *Houlletia odoratissima antioquiensis*, from Mr. E. L. Pynaert; to *Vriesia Gravisiiana*, from Messrs. Jacob Makoy & Co.; to *Epacris osmocephala*, from Messrs. F. Desbois & Co.; to *Cattleya Trianae* var., from Messrs. Edm. Vervae & Co.

A GIANTIC ORCHID.—A paragraph is going the round of the Press concerning a huge Orchid from the Straits Settlement. We have some information on the subject from the discoverer, which we propose to publish in an early issue.

HORTICULTURAL EXHIBITION AT BRUSSELS.—We learn that it is proposed to hold a grand horticultural exhibition in Brussels on the occasion of the jubilee fêtes of the accession of King LEOPOLD II. to the Belgian throne, which was in December, 1865. The project has been submitted for consideration to the Royal Floral Society and the Linnean Society of Belgium.

GISHURSTINE.—At this time, when catching cold is especially to be avoided, one means of prevention is by guarding against damp feet, the benefits derived from an occasional coating of the soles of shoes, if not of the upper leather, should not be lost sight of by gardeners.

M. PRILLIEUX. We are glad to see that the Paris Academy of Sciences has paid a well-merited compliment to M. PRILLIEUX for his studies in vegetable pathology, and in particular for his essay on the diseases of cereals.

ODEYPORE.—The annual report of the gardens of H. H. the MAHARAJA, G.C.S.I., is before us, showing that the garden suffered from drought and intense heat. During the cold season, English annuals thrive. Bamboos are found to do best in swampy soil. Eucalyptus does well. The Potato crop is reported to have been one of the best known in India. A large flower show was held in February under the auspices of Mr. T. H. STOREY, and was pronounced excellent, though it was arranged in haste in consequence of the anticipated visit of the Duke and Duchess of CONNAUGHT, who were, however, prevented from attending.

PLANT PORTRAITS.

ANTHRUM PLANTANAYANUM, *Illustrated Monographs*, December, 1889.

NIĞELLA HISPANIKA, *Garden*, February 8, 1890.
PEAR MANSCUETTE DE BOUGUES, *Bulletin d'Agriculture*, January, 1890.—Fruit medium-sized, Pear-shaped, somewhat oblique, with a short, thick stalk, and a deep eye; skin brownish-red, and speckled on the sunny-side; flesh juicy, perfumed, slightly acid; season, September.

SOLANUM WENDLANDI.—A warm-house climber, with large blue-blue flowers; very ornamental. *Garden*, February 1, 1890.

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM PLANERUM, AND C. DOLIARE.

MR. NORMAN C. COOKSON has recently sent to me an interesting series of *Cypripediums*, among which are especially to be noted specimens of *C. planerum*, *Rehb. f.*, and *C. doliare*, *Rehb. f.*, from the type plants. These are both hybrids, but the parentage of neither of them is known; Reichenbach, however, conjectured that *C. planerum* might be a hybrid between *C. villosum* and *C. venustum*, and thought that *C. doliare* might perhaps be of the same origin. Now that I have had an opportunity of examining them, I very much doubt if *C. villosum* had anything to do with their origin, for there is one very peculiar feature about the flowers of these two hybrids of which Reichenbach has made no mention. It consists of a very broad groove running down the underside of the lip of *C. planerum*, and a more feeble groove of the same kind down the underside of the lip of *C. doliare*. In preparing for a monograph of the genus, I have examined and drawn a great many forms, but I do not remember to have seen a similar groove in the lip of any other species or hybrid, except *C. Stonei*, in which it is very strongly marked. I learn, however, that *C. Rothschildianum*, and, I suppose, *C. Elliottianum*, also, have a similar groove, but I have not seen these in a fresh state. Can *C. Stonei*, or one of the hybrids derived from it, be one of the parents of *C. planerum* and *C. doliare*? There are two other circumstances that support this view in a slight degree, one is, that the sepal of *C. planerum* is two-lobed; the other, that the lower sepal of both hybrids has a tendency to divide into two component sepals, as is also the case sometimes with *C. Stonei*. Both hybrids are handsome and richly coloured, and as they have not yet been well described I add briefly their chief characteristics.

C. planerum, *Rehb. f.*.—Leaves strap-shaped, 5 to 6 inches long, and about 1 inch broad (in the specimen seen), dark green, with narrow, irregular marblings of blackish-green; under-surface pale green, with indistinct, very pale purplish mottling. Scape 1 or 2 flowered, brownish-pubescent. Bracts green, with purple nerves and speckles. Ovary pale greenish, dusted with purple-brown on the ribs, pubescent. Upper sepal 1½ inch long, by ½ inch broad; ovate, triangular pale greenish-white, with light green nerves, the middle nerves being purple-brown for two-thirds of its length; across the base is an indistinct, suffused band of pale purplish. Lower sepal ovate, entire, or divided into its two component sepals, pale green, with darker nerves. Petals oblong-spathulate, 2½ to 2½ inches long, green at the base, the rest purple, with the midline, some spots on the upper margin, and numerous dots at the base, all dark purple-brown; the nerves are brownish-green. The lip has a broad groove down the under side, the front part is of a very rich deep purple, veined with darker, and very shining; the inflexed sides are ochreous, with rather large purple spots. Staminal reniform, three-toothed in front, purplish, with green venation.

C. doliare, *Rehb. f.*.—Leaves oblong, 5 to 6 inches long, about 1½ inch broad, deep dull green, with indistinct, blackish-green, irregular, narrow markings; under surface densely mottled and dusted with dull purple. Flowers similar in general appearance to those of *C. planerum*. Upper sepal elliptic, 1½ inch long by 1½ broad, pale green, with a white border and darker green nerves, the central nerve being purple-brown. Lower sepal pale green, with darker nerves, ovate, entire, or divided into its two component sepals. Petals very shining, and very like those of *C. planerum* in form and colour, but darker without the green area at the base, and with a dark purple-brown spot or two along the midline. The lip has a slight groove down the underside, is shorter than that of *C. planerum*, and of the same rich dark purple colour, with darker venation, and is very shining; the inflexed sides are ochreous, with a purplish tint, marked with small light purple spots.

Staminode half-moon shaped, three-toothed in front. These two plants may not both have originated from the same two parents as Reichenbach supposed, but I think the flowers bear evidence that one of the parents must have been the same for both. *N. E. Brown, Herbarium, Kew.*

CATTLEYA LODDIGESII CANDIDA.

This is the Cattleya candida of the *Ochrid Growers' Manual*, where Mr. Williams states that the plant has become very rare in cultivation. A flower sent by C. Young, Esq., of 3, Royston Gardens, Richmond, perhaps belongs to the same, though it is whiter than the above is described, and also is without the dash of yellow on the lip. But Messrs. Veitch state that candida belongs to the form Harrisonia, on account of the corrugations on the lip. To my mind, however, the smaller side-lobes of Harrisonia afford more tangible character for separating it from typical Loddigesii, and viewed in this light Mr. Young's plant belongs to the latter, on account of the large and ample side-lobes of the lip. It is just possible that there may be a white variety of each form, but there is no specimen of the typical candida in the Kew Herbarium with which the new arrival can be compared. Perhaps some one will kindly bear this in mind when next they flower it. Mr. Young states that his plant was bought with others as Cattleya Harrisoniana (an older name than Harrisonia, be it noted). It is certainly a very beautiful thing. *R. A. Rolfe.*

WHITE LALIA ANCEPS.

Of the white Lalia anceps mentioned by your correspondent, "J. A.," the one in the collection of A. Heine (not Heimes) has this season had eighteen spikes of flowers, with three to five flowers on a spike. The variety is Sanderiana.

LYCASTE SKINNERI ALBA.

We have a plant here of the above, with one lead and thirteen spikes of flowers. *J. Crogg, Birchfield, Fallowfield.*

RAILWAY RATES.

We extract the following report of evidence, taken on February 12, from the columns of the *Times*:—"Mr. W. W. Berry, of Selling, Kent, near Faversham, examined by Mr. Balfour Browne, put in the agricultural classification agreed to at a Conference of fruit-growers and others in regard to agricultural produce and traffic. He described the labour at the Selling Station (London, Chatham, and Dover Railway) as very limited, possessing only a stationmaster, who had to issue tickets, and a porter, who had to attend all passengers, assist and relieve the signalman, and might give three hours' work in station terminal services to the traders, and yet £127 per annum was charged for this part of a man's work. An "average terminal" on the London, Chatham, and Dover system, would be most unfair on all the stations of line. He complained of the action of the London and Chatham and South-Eastern companies on carting, and he gave instances of what he considered overcharge. The fruit-growers asked to have the right conceded to them of doing their own cartage, if the railway companies—the London, Chatham, and Dover, and the South-Eastern—did not charge reasonably. The fruit-growers had brought a case against the London, Chatham, and Dover Company for charging a terminal at Selling, and won the case, and if the companies were admitted to charge an "average terminal," this allowance would reverse the verdict in that case. As to Hops, he said that the South-Eastern and London, Chatham, and Dover Railway Companies had doubly depressed the Hop industry by the charges for manure down and the high charges up, and this while merchants and brewers had their Hops carried at a less price. It often occurred that the same Hops sent to London at a high price would be sent back at a less price for cartage, though 25 per cent. had been added by the London journey,

thus giving an advantage to the brewers and merchants refused to the hard-pressed grower. On the subject of "load through rates," he said this was a most important question for the county of Kent, and unless the growers of produce got a "load through rate," say from Kent to the north, they could not send the produce to the north, where it could not be grown. The fruit would either rot upon the ground or be consigned to London, and then re-consigned to the north at a greater cost and deteriorated. The Kent growers of produce wished to reach the northern markets on the Great Northern Railway.—Lord Balfour of Burleigh considered that it was no part of the duty of the tribunal to investigate such matters. Mr. Balfour Browne thought that the illustration given could be properly brought before the tribunal, as showing the difficulties of the traders in getting through rates, and the danger of entrusting the railway companies with excessive powers in regard to maximum charges, which powers would be exercised by such companies as the London, Chatham, and Dover to prevent the producers of Kent from reaching the consumers of the north. The Great Northern Company was anxious to have the traffic, the traders were anxious to send it, and the consumers needed the produce; but the London, Chatham, and Dover refused to carry it unless they had the enormous mileage of 1s. 6d. a ton, in order to compensate them for the loss of their exceedingly high charges for cartage.—Lord Balfour of Burleigh considered that the question of rates between companies and companies did not come before the tribunal. The witness then gave evidence as to the necessity of soft fruit being taken to the market quickly—a necessity which was thwarted by the difficulties interposed by the London, Chatham, and Dover Company, except at great cost; and, with regard to the statement put forward by the London, Chatham, and Dover Company in justification of terminal charges at Selling on account of land purchased for the services, the witness said that the statement made put the land at three times the actual quantity held, and this had been proved by the association, who had had the station surveyed.

On the 18th inst., Mr. Berry, Hop and fruit grower, of Faversham, Kent, was further examined by Mr. Balfour Browne, Q.C. He stated that, in his opinion, Hops were as easy to load and carry as wool, and should be in the same class. In regard to perishable articles, he did not complain of a distinction being drawn between hot-house fruits, which were worth £100 a ton, and ordinary fruit, which was only worth from £15 to £16 per ton. The rates proposed to be charged would, taking a full year, have the effect of doubling the price of Kentish fruit to the customer. He thought the principle which was adopted in the grain trade, of accepting an empty package, no matter whence it came, should apply also to the case of fruit. He suggested that empties should be classed in class C, which would leave the traders in the same position as that which they occupied at present. He had prepared a table to show the excess of the cartage rates proposed to be charged by the London, Chatham, and Dover Company over the ordinary station-to-station rate. Maidstone was 41 miles from London, and the charge for Apples was by the sieve and half-sieve. It was unusual to send Apples in any other way; $\frac{3}{4}$ d. per sieve, or 3d. per half-sieve, was the rate quoted by the company, including delivery. The charge was 20s. per ton if packed in any other way, and the proposal of the company was to charge hereafter 16s. 3d. per ton for cartage by the sieve and 18s. 4d. for cartage by the half-sieve in London. In the case of soft fruit, the cartage of fruit in quarter-sieves would amount to £1 9s. 9d. per ton. The actual charge for cartage to the Borough Market was 2s. 1d. per ton, and 6s. per ton to Covent Garden, while, according to the present schedules, the charges were liable to be increased to £1 9s. 9d. and £1 10s. 3d. In the tables for vegetables, the same inconsistency between the actual and the proposed charges was apparent. Faversham was 52 miles from London, and Green Peas, Broccoli, and Sprouts were sent to London and charged $\frac{3}{4}$ d.

per package more than fruit, although the vegetables themselves might only be worth from 30s. to £2 per ton. From Faversham, including cartage, the rate would be 25s., while the station-to-station rate was only 9s. 2d.

In cross-examination by Mr. Pember, Q.C., the witness said that all the fruit-growers asked was that, if these charges were to be made in future, they should have the opportunity of doing the cartage themselves. At present they had no reasonable facilities for doing it. If they had such facilities, there was nothing to prevent them from carting their own goods from the railway terminus to the London markets.

Adverting to the Hop trade, he said it was true that the traffic came in gluts, but it arose from the fact that the company had no convenience for loading them except in the open air, and therefore they refused to accept Hops in wet weather. It was not an uncommon occurrence for the company to carry 600 or 7000 pockets upon one day, and only 1000 pockets upon another. The traders engaged in the fruit business simply asked for reasonable facilities for the reception and carriage of their traffic, and if the company were of opinion that it was unreasonable to ask them to keep their stations open all night, the growers would not object to pay a reasonable charge for the accommodation, say 1s. per ton. What they did object to was the proposal to charge them £1 9s. 9d. per ton for cartage. Apples were accepted by the London, Chatham, and Dover Company at the rate of fifty bushels to the ton. He believed that certain fruit growers at Sittingbourne entered into an agreement with the company in 1887 as to rates. The rates were lowered in consequence, but the real ground of the concession was that the Sittingbourne growers threatened to run a small steamboat to London in competition. Rainham, which also possessed the same water service, obtained similar terms. The reason why the steamboat competition was threatened, was that the high railway rates absolutely prevented the growers from obtaining a profit. The fruit traffic was usually carried on at night. The carmen in London preferred to work at night because the streets between Blackfriars and Covent Garden were less obstructed. If the traders did their own cartage, they could get it done for 2s. 6d. a ton.

THE ACTION OF LIGHT ON PLANTS (FIG. 37).

In my residence I have a small window which faces an unobstructed south light. About five weeks ago, a flower-pot containing a newly-planted rosette of leaves just taken from an old plant of *Saxifraga sarmentosa* was suspended close to the glass of this window. In a fortnight the new plant had taken vigorous root, and produced seven stolons or runners, as shown at s¹ in fig. 1, p. 237. At this time every leaf of the plant had turned and faced the glass, whilst the seven stolons grew in a straight line away from the glass. As the stolons grew and became pendulous, all the growing points were directed towards the room, and away from the light, as in fig. 2. These stolons, marked s¹, may be termed the stolons of the first generation. By-and-by, the first-produced stolons began to produce rosettes of leaves at their tips; and, as it was necessary that the leaves should receive light, the stolons now changed their curve, and grew towards, instead of away from, the light, as in fig. 3, and the new rosettes of leaves almost touched the glass. Stolons of the second generation now grew from the base of the new rosettes, as at s², and each of these new stolons again grew in a direct line away from the light, as shown in fig. 4. In turn the stolons of the second generation produced small rosettes of leaves, and recurved to the glass. These produced stolons of the third generation, which grew away from the light, as in the previous growths, as shown at s³, fig. 4.

The above observations were made under favourable circumstances before a small and strong light,

and it is obvious that nothing of the sort could occur in a greenhouse or in diffused light. At this time (after about five weeks) the three series of stolons are almost vertical from the weight of the rosettes of leaves. The stolons, with their rosettes of pendulous leaves in *Saxifraga sarmentosa* lend themselves readily to observations on heliotropism and negative heliotropism, although every observer of stolons in wild and garden plants must have noticed the tendency of stolons to creep into dark places, and there take root. Even in Strawberry plants I have sometimes been surprised to see the number of runners congregated in a more than usually shaded place. *W. G. Smith, Dunstable.*

THE ADVANTAGE AND UTILITY OF PLANTING WASTE LANDS.

(Continued from p. 192.)

It may be well now to descend to a few cases in point, and I will, as indicated in the early part of this paper, give two examples drawn from my own personal experience; first, one from actual returns drawn from a plantation at a given age; and second, the present returns from woods planted within the last twenty-five years. The first I refer to was a plantation on the estate of Culzean in Ayrshire, the property of the Marquis of Ailsa, where my father was forester for twenty-five years.

The plantation in question extended to about 20 acres, and was mostly composed of Larch, with only a sprinkling of Scotch Fir and hard wood. At the time to which I refer, this plantation was about forty-five years old. Prior to this it had been frequently thinned, and from returns in the Estate Books, sums varying in extent from 30s. to £5 per acre had been realised from wood taken out in the four previous thinnings, which, as far as my information went, would give a gross return for the first forty years of about £8 or £9 per acre. In the year 1861 it was again thinned, when the sum realised for what was cut was about £10 per acre. In the year following it was decided, in order to square up a neighbouring farm, that it should be wholly cut down. It was therefore put up in convenient lots, and sold standing, the purchaser cutting down and removing the timber, when it realised within a fraction of £35 per acre. After this the ground was let, with the adjoining farm, at a rent of 10s. per acre, for grazing and arable purposes. Now, let us calculate this more closely:—

Rent of land for forty-five years, at 10s.	£22 10
Expense of planting and enclosing per acre, say ...	4 10
Interest on the original outlay of £140s. per acre, compound interest, at 5 per cent., say ...	9 0
Expense of five thinnings, at 10s.	2 10
Total outlay	£38 10
Returns during forty-five years:—	
First five thinnings, say	£15 0
Ultimate sum realised	35 0
Total	£50 0

Showing nett profit, after paying rent, at the rate of 10s. per acre (the rent ultimately got for the land) of £14. If we then allow a deduction from this of £5, as the value of interest accruing in respect of unrealised rents of twenty-five years, we still have at our command a nett profit of about £10 per acre.

I give this as an actual example of realisation at the age of forty-five years; but had this plantation been allowed to grow for another twenty years, at which it would have been at maturity from the nature of the soil, the results, based upon an equally healthy state of the timber market, would have been even greater.

But while this may appear rather rosy, I am by no means disposed to say that all and every plantation would give similar results; on the contrary, I am prepared to affirm that such would not be the case, because the plantation in question was cut over at a time when timber was selling well. It was growing

near the seat of a large local demand, and was particularly accessible, therefore the results were good; but as against this, again, we must consider that the realisation was immature, and the cultivable value of the land was greater than any lands I now propose should be planted.

With these facts before us, I think it is abundantly evident that the hundreds of thousands of acres of waste lands in England, Ireland, and Scotland, which are at present realising nothing, and some not much more than 1s. to 2s. 6d. per acre, would pay to plant. If not themselves, at least in the shelter they would give, and the improvement they would exercise on the climate, and thereby add to the value of contiguous lands.

I will now give another example, which, although in some respects different from the former, bears upon the same subject, and points to a similar result, although as yet, to a certain extent, unrealised. In the year 1865, I was employed by Lord Powers-

FIG. 57. ACTION OF LIGHT ON *SAXIFRAGA SARMENTOSA*. (After p. 296.)

court as his forester on his large estates in Ireland, and among other things I was instructed to direct and conduct the laying out and planting of a large tract of waste land on his estates with the view to the improving and developing their resources. I may here say that he was one who possessed, in a very marked degree, those characteristics which ought to actuate every possessor of land. He saw in the afforesting of his estate, not only wealth to himself and his successor, but the improvement of the country generally, and the prosperity of its inhabitants. Well would it be if there were more such, not only in Ireland but elsewhere.

We commenced planting in the autumn of 1865, and from that time till the spring of 1871, enclosed and planted over 1,000 acres of waste land—land practically yielding nothing, being bare rocky mountain pasture. From information I have got, through a communication his lordship made to the *Times* newspaper in 1884, as well as private information I have from the forester and manager on that property, I learn that these plantations are now returning a

very fair revenue, and in particular the trees are being thinned out of them, realising from 6s. to 1s. each, even in a district far removed from a timber market. It may be said that this is in Ireland, and that the climate there is much better than in Scotland, but against this I have to say that the ground there was quite as bad as 9-10ths of the waste lands of Scotland, and the only difference is in the greater speed in the realisation of initiatory results. I may here state that the actual expense in planting those lands, including plants, planting and enclosing, draining being unnecessary, would be about £3 10s. per acre.

I could quote many other instances which have come under my notice in different parts of the country, but I do not think it at all necessary to multiply examples. That planting waste lands will pay there can be no doubt, either directly or indirectly, and although the planter may not have the full return for his money, how many proprietors are reaping the benefit of their predecessor's foresight. I consequently hold that it is not only a reciprocal duty they owe to their successors, but a duty to the State, that the thousands of acres of barren waste lands, up to an altitude of at least 1,000 feet above sea-level, should be gradually covered with woods, thereby storing up gradually increasing wealth for the national requirements in future years, when advancing civilisation in the great sources of our present foreign supplies shall denude these lands of their virgin forests, and when the coal fields of our own country shall be so exhausted as to demand supplies of fuel for the great national industries.

Let those, therefore, who are at present the possessors of land look to it that they do their duty by their possessions, and in this matter of planting our bare hills, and perpetuating our supplies of timber, look upon themselves not so much as merely the recipients of what wise foresight has provided for them, but as the stewards of the resources at their disposal for future generations. The full appreciation of this, sentimental though it may appear, will carry with it not only present pleasure in planting, but the idea of, as it were, creating not only wealth to the nation, but beauty to the landscape must, in all well-constituted minds, be happiness of the highest order. Let, therefore, all those interested in land, whether directly or indirectly, by example and precept, exemplify the maxim alluded to previously, "Aye be stickin' in a tree, it will be growin' when you're sleepin'."

NURSERY NOTES.

MR. C. TURNER'S.

A RECENT visit to Mr. C. Turner's nursery at Slough revealed a large stock of vigorous and healthy young Carnation plants. Among other varieties was the continental novelty Madame A. Warocqué, a sport from Malmaison; it has flowers of rich crimson, shaded to a paler tint at the base of the petal, and it is stated that the plant is of dwarf habit; if this be so, the novelty will become a favourite. This is not the best time of the year to visit a Carnation grower's collection, and only a few varieties were in a flowering condition. There was one fine white flower named Vesta which pleased us much; also an unnamed seedling of a rosy salmon-pink colour; the pod was long, and the flowers were borne up. Novelty is a curiosity rather than a beauty; it is one of the slate-coloured forms—slate, with bright crimson flaks. Coronet is an intense rich scarlet, which recalls Rising Sun, but is more of a red hue—very attractive. Madame Lombard, an introduction of last year, is a desirable flower, being rosy-magenta, very bright when the sun shines on it; a fine dark crimson-maroon is seen in Baron Rothschild, the flower being also of large size. T. W. Girdlestone, yellow, with crimson flake; and Herald, a new addition to the dark-coloured varieties, purplish-maroon, comprised the best of those in flower. Auriculas, of course, are kept in large

* A paper read by Mr. C. S. France at the Aberdeen Horticultural Association on January 8, 1890.

quantities, and a capital stock of plants is now at Slough. In the Camellia house were several trees bearing a grand crop of bloom, which is used for the cutting from *umbriata*, *Reine des Fleurs*, *alba plena*, and *Lady Hume's* *Blush* were the leading varieties. Other plants are also grown for cut flowers, and in this connection are *Azaleas Deutsche Perle* and *indica* *alba*, probably the two best varieties for the purpose.

FLOWERS IN WINTER AT MESSRS. H. CANNELL AND SONS.

A visit to the Swanley establishment at the present time would reveal not a few floral surprises, showing even at this comparatively flowerless period of the year what a wealth of subjects the florist has provided wherewith to make our plant houses interesting and attractive. Zonal *Peranioniums* would seem to be perpetually in bloom here. Of new colours, we may mention the new shrimp-pink seen in *Souvenir de Mirande*, a variety certificated last year at the Temple show, and looking better now than then. In mauve there is *R. Dean*, the raiser says, that is nearly blue, but to that we demur. *Dr. Tucker* is a purple—the purple of *Rollison's Unique*—rare in zonals hitherto. Rose-pinks abound, and magenta is not scarce; blush-white is seen in *Duchess of Fife*; and crimson, tinged with purple, in *Lord Brassey*. There are very dark shades of colour and various scarlet tints, for whose names we must refer the reader to Messrs. Cannell's voluminous list. In white flowers we must not omit *Any Campbell*, *Lily*, *International*, and *Swanley*, single flowered.

Amongst miscellaneous subjects, three houses of *Primulas* were in full beauty; the notable varieties being *White Perfection*, *Cannell's Pink*, *Improvement*, red; *Swanley Blue*; *Blush white*; *Eyusford Pink*, lovely rosy-pink colour; *Her Majesty*, pure white, a robust-growing variety; *Eyusford Red*, a telling flower, the blooms being freely produced, &c. We noticed a fine batch of crosses and other seedlings of merit, some of them far in advance of anything in this way yet in commerce. They will doubtless be heard of. *Cinerarias*, both double and single-flowered, gave promise of being very fine about the middle of this month. *Begonias*, winter-flowering; one house is just now in full beauty; the following are a few of the most prominent sorts:—*Semperlorens*, *gigantea*, *carmine*, *nitida*, *nitida alba*, *hybrida*, *multiflora*, *Carrieri*, *E. Pynaert*, *Gloire de Senoux*. A long house of *Tree Carnations*, just coming into flower, gave a welcome glow of colour. Amongst fine kinds, *Bridesmaid* is the best of all the whites, and *Crimson King* the best habit, flower, and colour of this class. Of course the older and popular varieties are grown, and in quantity, such as the indispensable *Miss Jolliffe* and other sterling sorts.

Amongst winter-flowering new varieties of *Heliotropes*, *White Lady* is a very free-flowering variety, bearing large heads of bloom, fine habit, and under a system of warm treatment can be had in flower the greater part of the year—a decided acquisition amongst this deliciously-perfumed tribe of plants. *Cyclamens*, in a good sized structure, were observed just coming into flower, and promising some good things. *Gesnera zebra* *discolor*, a grand lot, in full flower—orange, scarlet, and yellow blooms.

THE CLOVER AND GRASS CROPS.

THE SEED TRADE.—An English estimate of the past Clover, Grass, and forage seed harvests, comes to us from Messrs. Hurst & Son, seed merchants, of Houndsditch. Nearly every season produces some conditions entirely different from its predecessors, and it is highly requisite that early knowledge of the probable supplies should be procured in order that a true and fair market value may be established at the outset.

A leading feature of the coming season will be a plentiful supply of English red Clover. Messrs. Hurst & Son have long advocated the superior claims of home-grown red Clover seed over almost all that is foreign grown, and their wisdom in doing this

was strongly exemplified last summer, thus confirming the experience of previous years by experiments carried out at their trial grounds with seeds sown in 1888 and treated under equal conditions. With the exception of Lowland Dutch, which produced the heaviest yield of forage of all the trials, home-saved seed came most markedly in advance of any others, American and Canadian seeds producing the lightest. As red Clover is likely to rule moderate in price, there will be laudable economy in using seeds free from weeds. The recent Merchandise Trade Marks Act, if properly enforced, will undoubtedly help to prevent the scandalous frauds of previous years of mixing foreign seed with English, and passing it off as all of home growth.

In reference to English red Clover and Cow-grass, Messrs. Hurst & Son say the crops are quite the converse of what they were stated to be in their last report. From the fact that the hay crop was so abundant, and the prospects of the hay crop so good, farmers did not require Clover hay, and left their Clover leys for seed, so that a larger acreage has been cut for this purpose than for many years. Reports from the Eastern counties, do not anticipate that the quality, or perhaps the yield, will be up to the average of good years in those districts; but the Southern and Western counties will more than compensate for any deficiency, although it is expected that generally, fine deep-purple coloured samples will be scarce. What is known as single cut Cow-grass is only sown over a limited area, and from these districts we have reports that the crop will prove an average one of medium quality.

As to foreign red Clover, owing to the abundance of home-saved seed, foreign red is not so important a factor with the dealers as last year. The crop in France is large, and much of the seed of good colour. Bold and clean samples from the northern provinces will command good prices, as with buyers a good sample is a prime consideration. Germany is reported to furnish a large crop of seed, but not of the finest quality; up to the present the few samples seen have been quoted at prices much in excess of current values. America has a large crop of small-grained seed. Canada has sent but little seed to this country for years; in fact, she imports from the States a considerable proportion of her own requirements, and this year will have to do so again. On the Continent, dealers are holding over a considerable quantity of yearling red, which may eventually find its way to our market, and be sold at low prices.

Of white Clover there is a large crop of English seed, the quality is inferior, injured by rain, and more than usually mixed with weeds. Germany has an average crop, and some fine samples are expected to put in an appearance from there as soon as frosty weather will allow of threshing taking place. Good growing yearling seeds are quoted at low prices at the markets.

Alsike Clover is a fair crop in England, the quality varied, and generally the samples are poor in colour. Trefoil is also a large crop in this country, but the seeds under average quality. Lucerne is also of good quality, but a short crop. French-grown Sainfoin is a short crop, while the English crop of Giant is reported short, and to lack average quality.

Of Italian Rye-grass, the crop of French seed is below the average both in quality and quantity. The Irish crop is very heavy, and of unusually good quality. Had it not been for the large yield in Ireland, French seed would have ruled considerably higher in price. There is an exceedingly heavy crop of perennial Rye-grass of heavy natural weight, but prices are very low; so much so, as to be quite unremunerative to the producer.

In regard to natural grasses, owing to the greatly diminished demand during the past two years, most of them have declined in value. Timothy is in large supply at low prices. Cock's-foot is plentiful, but clean samples free from *Holcus* are difficult to get. Meadow Fescue is a short crop. White Fox-tail is a

good crop of fine quality. Dog's-tail is plentiful, and much finer than usual.

White Mustard is a short crop in England, but large supplies of fine quality are coming in from the Continent and California. Rape is a very short crop, and the average in England is the smallest on record. Genuine home-grown samples are certain to command high prices.

HOME CORRESPONDENCE.

THE ROYAL HORTICULTURAL SOCIETY.—Recently attention was called to the fact that the loss of Fellows of the Royal Horticultural Society was more than recouped during the past year by new guinea Fellows; and it is very obvious that now the public is beginning to understand how many privileges are offered to the guinea Fellow for so comparatively small a subscription, guinea Fellows promise to very rapidly increase. But all the same, this increase is by no means sufficiently rapid, because the society should have a constituency of some three to four thousand instead of but 1000, as at present. Recently, on receipt of the annual report—with accompanying appeal to secure, if possible, at least one other Fellow—I sent into the secretary seven names of residents in my locality, not unlikely to become Fellows, if properly invited from headquarters. Oidly enough, a very few days later one of these persons called and asked me to submit his name to the secretary of the society for election, although I had never mentioned the matter to him. I could perhaps later send a few other names for a like purpose. I mention this, because there are probably scores of Fellows who, like myself, have some considerable knowledge of the tastes and habits of persons in their respective districts, who would, if applied to, be not unlikely to become Fellows; and were, say, one hundred names per month sent in to the secretary, and each of these were furnished with reports, and special appeals, it is probable that through such means a very large addition of Fellows might in time be made to the Society. It should be obvious that all round the suburbs of London may be found large numbers of persons who, being fond of their gardens, would be pleased to join the Society at the reduced rates of payment. Those who reside near London can attend the meetings, shows, and conferences, and sometimes visit Chiswick, much more freely than can country Fellows; and for that reason the district round the metropolis should be widely worked. The recent proposals of Baron Schroder with respect to the providing of a permanent hall or home for the Society in London, lends additional interest to the Society's work just now. It shows to Fellows and outsiders alike that a real effort is being made to get free from the Drill Hall and its surroundings, and to make a central home worthy of the Society. The intention thus so enthusiastically promoted should be made as widely known as possible through the general press. If the public were led to perceive that the Society, so far from being in difficulty, was rising to higher flights, and looking confidently to success, its popularity would be enormously increased. The public believes in energy and success; and if assured of that will join in helping to that end freely. It is greatly to the Society's advantage that its ambitious scheme of a central home is in the hands of so able a financier as Baron Schroder. Many will follow the Baron's financial lead, who would fail to regard the proposals of less capable men. In your leader report of the recent meeting, you mention that the Fellows did not exercise their right to nominate members of the Council. The fact that notices to nominate must be given fully a month previous to the date of the general meeting practically prevents any such nomination being made. Could that period be reduced to one week, and the Fellows more fully notified, say twenty-one days beforehand, that such nominations must be made by a certain date, it is most probable the privilege of nomination would be used at times. Although the Council doubtless make the best selections possible, yet it is certain they ought to find pleasure in inviting the Fellows to make such nominations. The sending round of voting or ballot papers, when only sufficient nominations are made to fill the vacancies created, is such a farce that some effort should be made to give the assembled Fellows an opportunity to exercise their voting franchise in a common sense form. The Council should consider that the Fellows have

the same desire to promote the interests of the Society that the governing body has, and act accordingly. But for the speech of Baron Schroder, the proceedings of the recent general meeting would have been of such an uneventful kind, that Fellows could hardly be expected to find pleasure in attending future ones. The greater the interest created, the greater will be the satisfaction with which the meetings will be regarded. The fullest confidence on the one hand will inspire confidence in return, and the interests of the Society be greatly benefited. *A. New Fellow.*

DIELYTRA SPECTABILIS.—Although this is one of the most beautiful of hardy plants, it is one of the most neglected; at least, it would seem to be so, for how seldom it is that one sees it in flower borders; and yet, when it is met with, how very striking and handsome it is in bloom. To have it at its best, outdoors, it is necessary to plant in a sheltered situation, as, owing to the early growth it makes, it is otherwise apt to be cut by cold winds or damaged by frost, which cripple the young shoots, and thus spoil their flowering. One of the finest and most effective specimens that I ever saw was planted on a grave just in front of the white-headstone, and a more appropriately suitable plant could not be thought of, with its gracefully drooping stems and branches with the "bleeding hearts" depending from them, looked so fitting and suggestive of being bowed down by grief. Not only is the *Dicentra* well adapted for the situation and purpose referred to, but it is equally so to brighten up a greenhouse; it lends a cheerful aspect to the plant stages, and as a plant for a vase it is charming. When desired for the latter purpose, it should be gently forced under glass, as then the delicate tints of its foliage are heightened, and the colour of the flowers improved. Big plants may be taken up and divided into medium sized pieces, these looking better in pots than large ones, except for certain purposes, as niches in corridors, &c. To propagate and prepare a stock, division of the crowns must be resorted to, and every portion that has a bud will form a plant if not allowed to dry and shrivel before being put into the ground. The time to do this is just before growth commences, and to grow them well the plants should be planted in light rich sandy soil in a warm place, a border under a sunny wall or fence being the most suitable. *J. S.*

STATE OF THE SOIL.—Those who have so far resisted the temptation over weather and soil in good tilth has presented, to make early sowings of seeds, must have felt cause to rejoice when they saw the weather of the 15th inst.—heavy snowfall in the morning, and thin snow with cold rain and wind all day until a late hour of the night, followed by white frost the next morning. How many must have felt that seeds were far better in their packets or bags, than sown in the open ground and exposed to such dread influences as these. The greater portion of the failures which result after seed sowing arises from the tendency to commit seed to the soil long before there is warmth and sunlight sufficient to create healthy germination. We had far more suitable weather for seed germination in January than we have had since, but it would have been folly to have sown so early. We cannot hope, let the weather conditions be what they may early in the year, to have sufficient light to produce both robust and rapid growth until the middle of March is reached, and if the bulk of the seeds, excepting certain hardy Peas, Beans, &c., germinate in April, the better will it be all round. Slugs are as much as ever terrible pests to young seedlings, but the more rapidly the young plants make growth the less harm results from the slugs. Plants that are checked in their early growth by an interval of frost, clouded sky, or biting east wind, never make good healthy growth later. Of course, sowing of seeds must be largely contingent upon situation, but I write chiefly for what are known as the midland or home districts. Those who haste to sow are often like those who haste to be rich—they only reap failure for their pains. *A. D.*

LÆLIA ANCEPS DAWSONI AND ITS VARIETIES.—It would have been interesting if "J. A." had told us why these new *L. anceps* should not have descriptive names. "J. A." says they are all varieties of *L. a. Dawsoni*. Now, admitting that, if some at least of these names are not kept, how shall we be able to distinguish the different varieties, of which there are three that are as dissimilar as *Dawsoni* is from *L. alba*. There can be no doubt that these

plants were very much mixed up at the time they were imported, and there can also be no doubt that a great number of these plants are to be found under names which will very likely turn out to be wrong ones; but, as far as I have seen, three distinct names must be retained to give an idea of the variety meant. Take, for instance, *L. a. stella* or *vestalis*, which I consider are synonyms. Again, take *L. a. Sanderiana*; "J. A." does not consider that this ought to be classed with the others. I fear his mind is not altogether free from bias. My own impression is, that it is a strong rival of *L. Dawsoni*, which he flowered so many years since, and looks upon with parental affection, as well he may. There is now *L. a. Schroderiana*; this, I have little doubt, "J. A." had not seen true at the time he penned his note, even if he has yet. This is the most distinct, and altogether the finest of those I have hitherto seen. The petals and sepals are larger than any of the other pure white varieties, and is also the labellum, with the exception of the orange-yellow stripe running up into the throat. The labellum is lobed, and folded over at the apex of the wings in a way quite distinct from any other *anceps*, and which then spreads out flat and broad. This is the variety which will be sought after when it becomes generally known. "J. A." asks, if a plant with seven spikes and thirty-five flowers is the best plant yet flowered? I do not know if any finer have been flowered than one which I had here with twelve scapes, and fifty-one flowers; this was *L. Sanderiana. A. G. Carl. Packfield.*

QUASSIA.—I notice that this is recommended, or spoken of, as a preventive to birds devouring *Crocus* and fruit buds; but bitter Aloes is far more powerful, as a tiny piece of that leaves a taste in the mouth that remains a very long time, but whether it would remain on fruit bushes or trees without some vehicle such as lime, or limed clay, I do not know; if it would do so it would be a boon, certainly, to growers of fruit. *Ed. J. S. Gard.*

TREE CARNATIONS.—At Membrand Hall, the residence of Lord Revelstoke, near Plymouth, a lean-to house is devoted to Tree Carnations. In the centre of this house a bed is planted with plants which have flowered one winter in pots; and there they are allowed to remain for two years, when they are thrown away, and the bed replenished with fresh soil and replanted as before. Narrow stages run along the front and ends, and on these stand the plants in pots. Judging by the quantity of bloom in the house on January 24, the gardener, Mr. Baker must obtain a very large quantity of it during the winter. *Constant Robin.*

THE WEATHER AND THE FRUIT CROPS.—Apples do not appear to have moved much, although other fruit trees have done so in a marked degree. Pear bloom will soon be at the mercy of frost, and *Pæras* too, which are getting forward, look well set with fruit-buds. The flower on nut bushes have been out in prodigious numbers, and as the weather was warm and favourable in East England, there must have been a good set. Strawberries seem to be at rest, and to protect them the old foliage should be preserved, as this forms the best shelter for the young leaves and flowers, and the ground between the plants should not be dug or broken, but a mulching of half-rotten manure or short stable dung applied. *J. S.*

MANURE TANKS.—I daresay that other owners of gardens have been bothered as I have been in getting cesspools or manure tanks emptied to the bottom. A short time back I was in the garden of an experienced friend, when he showed me a chain pump he had bought at the auxiliary stores, and had found it to answer its purpose perfectly. I bought one for Oakwood garden. My people then at first sight seemed not much taken with it, but now that it is in operation, speak very highly of it. It is simple in construction, and seems to pump everything up. It was new to me, so perhaps it may be so to others; I suppose that it can be had from any horticultural implement seller. The rats and mice ate our flowers in the wild garden; we had, therefore, to wage war against them, and since October 9 have caught 66 rats and 321 mice. *George F. Wilson.*

CHINESE NARCISUS TAZETTA GRAND EMPEROR.—When this bulb is generally known, I have no doubt it will prove a general favourite. I planted two dry bulbs on December 20, and in five weeks, in an ordinary sitting-room, they were in full bloom, the two bulbs producing thirteen spikes, with sixty-

five flowers on them. After three weeks they show no signs of fading. I planted them in rough stones, with a little sand on top. Whether they will be as luxuriant another season is questionable, as I think they must have received some special treatment to force their blooming powers. The perfume is very sweet, but rather different from other *Tazettas*. *Oloavius Corde, Brandt, Norwich.*

VISCUM ALBUM, OR WHITE MISTLETOE.—This is a plant very much admired by most people, and always attracts attention when it is seen; its remarkable habit of growing out of the body of trees always strikes the observer. This plant is to a tree what the cancer or tumour is to a human being, a parasite living at the expense of others. It is very easy to cultivate; in fact, I find the greatest difficulty is to destroy it. Many persons are very anxious to obtain it, and will say they cannot get it to grow. The only method I pursue is to take a ripe berry at any time, place it on the bark of a tree, and rub with the thumb tip and down until it adheres to the tree; and if the berry is a good one, and not injured by the rubbing, it will sprout. It matters not where you place them—no particular place is required, only it must be on a clean part of the rind; it will sprout on a cannon ball, stone, window-frame, or anywhere; but after sprouting, and turning the radicle on to the part it is on, it is not a suitable place, it will dry up. It makes a very small amount of growth the first year, merely leaving the berry and straightening out. It only makes one joint in a year, and it will also grow as a double parasite, as was shown in these columns some years since. There are different forms of growth; some are very small in foliage, and others large, and very long-jointed. There are masculine and feminine forms, as some never produce a berry, and are much yellower than those which bear fruit. *J. S. C.*

STAKING YOUNG FRUIT TREES.—Where trees have to be planted which are three feet or more in height, it is much better to make them provisionally secure against the wind, until the soil has settled together with the roots of the tree. It is a good practice to secure each day all trees that have been planted, so that none blow away get loosened in the soil by the action of the wind and rain. This is not only a saving of much time in reinstating the trees, but saves also many roots that would otherwise be broken. The usual plan of securing trees from 2 feet to 6 feet high, when not top-heavy, is to drive one stout stake into the ground, close to the tree, and about one-third of the height of the tree. A piece of sacking or cloth about 3 inches wide is then bound round the bark of the tree, opposite the top of the stake which is intended to fix the tree in position by the aid of rat rope or some such material the tree is made secure to the stake; but this, by the constant movement of the tree by wind, becomes loose, and the bark of the tree gets chafed against the stake, and the protecting pad slips down lower than where it was at first. I now adopt a much safer plan, and instead of driving the stake into the ground close to the stem, it is placed 1 foot from it, and in some instances rather closer. Protecting material is used round the stem; instead of using rope or tarred twine, we use a stout wire of Hazel, which is first bound round the tree, then twisted tightly which prevents the tree moving at all as long as the stake remains firm; the wire is then made secure to the stake. *E. M.* [If two or even three stakes are employed, and the tree secured by withes or straw bands, as was figured in these pages, a tree is made secure even in the windiest of places. *Br.*]

HARDY PRIMROSES.—The show of the National Auricula Society is fixed for April 22, some three months hence, and yet I have scores of fine Primrose plants in just that stage of blooming I should like to see them in early in April. As it is lifted and put into a greenhouse or frame, they soon come into full bloom. If some of those satiated persons who are always seeking for new sensations or methods of spending their money would construct a low span roof house, about 12 feet wide with a timber path running through the centre, make on either side half raised soil-beds, with some irregular rockwork on clinkers fixed on the surface, partly covered with moss, and plant in all the bare places strong Primroses of many colours, they would have a wondrously beautiful show of flowers from the beginning of the year, if not indeed earlier. Only sufficient warmth would be needed to keep the atmosphere dry during damp weather, and

top heating would answer best for that purpose; but during all ordinary open dry weather, no warmth would be needed. Where there were plenty of strong plants, and myriads may be had simply by sowing seed and planting out in bedding soil, exhausted plants from the house could be replaced by others from the open ground, and a charming succession of flowers maintained in this way for four months. A. D.

CHRYSANTHEMUM MRS. S. COLEMAN.—One would imagine that that which I wrote on p. 637 of the last volume of the *Gardeners' Chronicle*, respecting this Chrysanthemum was an effort of the imagination, if I may judge from the remarks of Mr. M. Russell, p. 52, where he says, "I probably had not even seen a flower of it developed from the crown bud," when in fact I saw the first flower of it that was staged by himself at the Portsmouth show. This flower, as I gather from his remarks on the same page, was from a crown bud; this I think is sufficient proof that I really had an opportunity of seeing a flower of this variety in what Mr. Russell calls good form. I venture to say it will require to be considerably improved, or there will not be any necessity for me to alter my opinion that "Mrs. S. Coleman will prove less serviceable for exhibition than any of the type," *E. Molyneux*.

CAMELLIA BUDS DROPPING.—All that your correspondent, Mr. Saunders, has said on the above subject does not affect my contention that Camellias which drop their buds are not necessarily unhealthy; as those which do so with me occupy a similar position, and receive treatment in no way differing from those which flower so freely. The variety which occupies the back wall of theinery and drops its buds, is *Antwerpensis*. The drainage is the same throughout the border. Mr. Saunders has not read my notes aright, I think, as I did not wish him to infer that these suffer from drought, for then I should have expected the whole of them—more or less—to have shed their buds. Turning back to his notes, vol. vi., and the advice he gives "Subscriber," p. 632, he says "immediate attention may preserve the remaining buds and flowers (with the proviso), should the plants be healthy." If the plants dropped their buds they are unhealthy, according to his views. Here he practically admits that healthy plants may drop their buds. *W. H. Stephens*. [Healthy Camellia plants will, under certain conditions of management, cast their flower buds; and unhealthy plants, that is, badly-rooted plants, in soured, wet, or very dry soil, always do so should they indeed set any bloom buds. En.]

IRISH APPLE, GIBBON'S RUSSET.—I venture a word in praise of this little known Irish variety of the Apple. Hitherto it has been localised in the South of Ireland, and possibly neither scions nor trees have as yet reached England. I may be wrong. Can you, Mr. Editor, or any of your readers, give me the information? *Corkistan*. [It is not mentioned in the Apple Congress list. En.]

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

FEBRUARY 11.—Present: W. T. Thiselton Dyer, C.M.G., in the chair; and Professors Michael Foster, A. H. Church, H. Marshall Ward, D. H. Scott; Messrs. G. F. Wilson, T. Francis Rivers, H. J. Veitch, W. F. Blandford, R. McLachlan, Dr. Oliver, and D. Morris.

Mealy-bug at Alexandria.—Mr. Morris supplemented the information already given by him respecting this new Egyptian pest, by reading a letter from Mr. J. W. Douglas, to whom the specimens had been sent, stating that the coccids had proved to be not only a new species but a new genus. It was proposed to describe them under the name of *Crosotossoma aegyptiacum*.

Growth on Stem of Cattleya.—Mr. McLachlan reported on a peculiar growth on the stem of a *Cattleya* from Brazil. This was at first supposed to be of the nature of a cocoon, but a careful examination of the structure had shown it to be a gall. Professor Marshall Ward undertook to make further examination.

Sugar-cane borer at St. Vincent.—Mr. McLachlan drew attention to a disease in Sugar-cane at St. Vincent, where in some localities about 25 per cent. of the crop would be lost this year. According to Mr. Herbert Smith, who had examined the canes, a beetle of the family Scolytidae, and the larva of a moth, were concerned. It is probable that the beetles only enter the canes by the exit holes of the moths. The moth is probably a widely spread species, already known to attack Sugar-cane in other countries. The affected canes should be burned, and steps taken to destroy the moth in the localities specially frequented by it.

Disease of Orchids.—Mr. Morris exhibited several specimens of a *Cattleya* attacked by a fungoid disease of apparently a very virulent character. From a specimen received about a fortnight ago, Mr. Masseur, at Kew, had infected two or three healthy plants, and in three days the whole of the pseudobulbs had become diseased. Specimens of similarly affected plants were sent by Mr. James Douglas from a gardener who was anxious to know if there was any remedy, as he feared his collection was in danger of being destroyed. The committee was of opinion that the disease, whatever the cause, was of a very virulent character. It was not the ordinary "spot" so well known to Orchid growers. The specimens were referred to Professor Marshall Ward, who had already given some attention to the subject.

Orchid Hybrids.—Mr. H. J. Veitch exhibited *Cypripedium Lathamianum* ×, raised first at the Birmingham Botanic Gardens, by crossing *C. Spicerianum* ♂ with *C. villosum* ♀. Messrs. Veitch had raised similar hybrids, and had, moreover, raised hybrids from the reversed cross. Plants from all three sources were shown. These agreed so closely in all essential points, that they must bear the same name. The fact of plants obtained by crossing, and also by reverse crossing, producing seedlings of almost exactly the same character, is very interesting. Similar results have been obtained by Messrs. Veitch in crossings which have produced *Cypripedium Sedenii* ×, and *Fuchsia Dominicana* ×.

Mr. H. J. Veitch also exhibited a new hybrid *Dendrobium*. The seed-bearing parent was *D. japonicum*, and the pollen parent *D. Wardianum*. The hybrid, *D. Wardiano-japonicum* had smaller pseudobulbs than *D. Wardianum*, but the flowers were nearly those of *D. japonicum*, only larger and with broader segments. They were also highly scented, as in *D. japonicum*.

Canker in Apple Trees.—Professor Marshall Ward brought before the committee specimens of Apple trees badly affected with the so-called canker, on which there were numerous red perithecia of a *Nectria*. It is probable that the initial injury in this case had been caused by frost, and that the *Nectria* had established itself in the cracks thus formed.

Abies nobilis.—Mr. James Douglas forwarded branches of *Abies nobilis* affected by gouty swellings, due probably to the attacks of an *Aecium* (Phytophthora), or to *Leididium alatum*. Professor Marshall Ward kindly undertook to examine the specimens.

London Fogs.—Dr. Oliver and Professor Scott presented an interim report on the investigations undertaken by them respecting the effects of London fogs on plants under glass. Specimens of Orchids affected by fog had been received from Messrs. Veitch & Son, Chelsea; and of Tomato plants from the Superintendent of the Royal Horticultural Society's gardens at Chiswick. On the suggestion of the chairman, it was decided to take up an investigation of the chemical constituents of London fog, and trace the exciting cause of the injury to plants. The question was a very important one, and likely to demand considerable time and attention. In order to carry out the work under advantageous circumstances, it was resolved to make application to the Government Grant Committee of the Royal Society for £100.

The following is a list of the members of the Committee for this year:—

Chairman.—Sir Joseph Dalton Hooker, K.C.S.I., M.D., C.B., F.R.S., The Camp, Sunningdale.

Vice-Chairman.—W. T. Thiselton Dyer, C.M.G., F.R.S., Royal Gardens, Kew; Professor M. Foster, Sec. R.S., Great Shelford, Cambridge; Maxwell T. Masters, M.D., F.R.S., Mount Avenue, Ealing, W.

Hon. Secretary.—Rev. Professor G. Henslow, M.A., F.L.S., F.G.S., Drayton House, Ealing.
Baker, J. G., F.R.S., Royal Gardens, Kew.
Blandford, W. H. F., M.A., F.R.S., 48, Wimpole Street, W.

Burbridge, F. W., F.L.S., Trinity College Gardens, Dublin.
Church, Professor A. H., F.R.S., Shelsley, Richmond.

Darwin, Francis, F.R.S., Wychfield, Huntingdon Road, Cambridge.

Dod, Rev. C. Wolley, Edge Hall, Malpas, Cheshire.
Elwes, H. J., F.L.S., F.Z.S., Preston House, Cirencester.

Frankland, E., F.R.S., The Yews, Reigate Hill, Reigate.

Gilbert, J. H., Ph.D., F.R.S., Harpenden, Herts.
Godman, F. Du Cane, F.R.S., 10, Chandos Street, Cavendish Square, W.

Llewellyn, Sir J. T. D., Bart., F.L.S., Penllergare, Swansea.

Lynch, R. Irwin, A. F.L.S., Botanic Gardens, Cambridge.

McLachlan, R. F.R.S., Westview, Clarendon Road, Lewisham, S.E.

Michael, Albert D., F.L.S., Cadogan Mansions, Sloane Square, S.W.

Müller, Hugo, Ph.D., F.R.S., 13, Park Square East, Regent's Park, N.W.

O'Brien, James, Harrow-on-the-Hill.
Oliver, F. W., D.Sc., F.L.S., Royal Gardens, Kew.
Pascoe, F. P., F.L.S., 1, Burlington Road, Westbourne Park, W.

Plowright, C. B., F.L.S., 7, King Street, King's Lynn.

Salvin, Osbert, F.R.S., Hawksfold, Fernhurst, Haslemere.

Scott, D. H., Ph.D., F.L.S., The Laurels, Bickley, Kent.

Symons, G. J., F.R.S., 62, Camden Square, N.W.

Veitch, H. J., F.L.S., Royal Exotic Nursery, King's Road, Chelsea, S.W.

Vines, Professor, F.R.S., Fairacres, Oxford.

Ward, Professor, Marshall, F.R.S., The Laurels, Englefield Green, Staines.

Wilson, Geo. E., F.R.S., Heatherbank, Weybridge Heath.

Members of the Council are Members of all the Committees.

NATIONAL CHRYSANTHEMUM.

FEBRUARY 17.—A largely attended meeting of the committee took place at Anderson's Hotel, Fleet Street, London, on Monday evening last, Mr. E. C. Jukes in the chair. Six new members were elected, and the Norfolk and Norwich Horticultural Society admitted to affiliation. The meeting then proceeded to the election of five members of the Floral Committee, the choice falling upon Messrs. George Gordon, W. Boyce, C. Gibson, H. Cannell (old members), and Mr. H. J. Jones. The dates of the meetings of the committee for 1890 were fixed for September 10, October 15 and 29, November 11 and 25, and December 10, 1890, and January 7, 1891. The sub-committee appointed to arrange for and carry out the proceedings of the Centenary Exhibition and meetings in November next presented an interim report, in which it was stated that they had arranged for a centenary festival, including an exhibition, conferences, banquet, &c., to take place on November 11, 12, 13, and 14, at the Royal Aquarium; they recommended that the sum of £485 19s. 6d. be offered as prizes, independent of those specially contributed; that they had introduced, as special to the occasion, a centenary class for forty-eight blooms, to consist of twenty-four incurred and twenty-four Japanese, distinct, the prizes being £25, £20, and £15—the highest amount, it is believed, yet offered in such a class; that they had accepted prizes and medals from the *Veitch Memorial trustees*, the proprietors of the *Journal of Horticulture, Gardening World*, and others; that an advance in the value of the prizes has been carried out in most of the classes in the schedule; they also proposed that a special Bronze Centenary Medal be presented to every exhibitor in the large cut-flower classes, 1, 3, and 10. All entrance fees will be abolished, save in the case of non-members. Special Centenary Medals will be struck, and one of these will be placed at the disposal of every affiliated Society.

The report of the sub-committee was unanimously adopted, and the members were thanked for their labours. It was announced that the Marchioness of Headfort and Baroness Howard de Walden, with others, had consented to become patronesses of the Centenary Exhibition, the latter also sending a donation of £5. A vote of thanks to the chairman closed the proceedings.

LAW NOTES.

PROSECUTION OF A SALESMAN.

FREDK. WISE, who was lately committed at Bow Street Police Court for trial, was brought up at the London Sessions, Clerkenwell, before Sir P. Edlin, Q.C., on Tuesday last. Mr. G. P. Grain, instructed by Mr. C. Butcher, solicitor to the Nursery and Seed Trade Association (Limited), appeared to prosecute, and Mr. Besley, instructed by Mr. Ashton, solicitor, defended.

The Grand Jury having returned a true bill, the prisoner, acting under advice, pleaded guilty.

The facts of the case (stated the learned Counsel) were as follows:—Up to September, 1888, the prisoner was in partnership with Mr. Rides, and occupied stall 360 in the Flower Market, Covent Garden. After he left that stall, he had memoranda forms and bill-heads printed, "Frederick Wise, 360, Flower Market, Covent Garden," and the false pretence alleged was that he thus held himself out as a *bona fide* stall-holder, whereas since that date he never had any stall inside the market, and by this means he obtained from Mr. T. Jannock, of Dersingham, flowers to the amount of £33 7s.; from Mr. Cook head gardener at Compton Bassett, Wilts, fruit and flowers to the amount of £14 2s.; and from Mr. Summers, head gardener, Sandbeck Park, Yorkshire, flowers to the amount of £7 5s. 4d.—in all a total of £54 14s. 4d. When the prisoner was arrested, there were found in his possession letters and papers from other persons, but he (the learned Counsel) was only prosecuting in these three cases. The prisoner had traded on the credit thus obtained, by representing himself as a stall-holder in the market, and had thus defrauded the prosecutors.

In answer to the learned Judge, Mr. Grain stated that the prisoner had been, in January, 1889, warned of his legal premises.

The learned Judge, in passing sentence, said that he would take into consideration that the prisoner had been in custody since January 10. He would only send him to three months' imprisonment with hard labour.

THE WEATHER.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—i.e., Day-degrees" signifying 15 continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.	BRIGHT SUN.	
	Above 42° or below 42° (the week ending February 15).	Days-deg.	Day-deg.	Day-deg.	10ths Inch.			In.
1	2	30	40	17	4	75	87	17
2	4	56	49	52	1	27	53	21
3	2	0	34	36	1	56	2	17
4	0	41	33	44	1	29	30	43
5	5	0	54	34	29	2	36	24
6	4	0	35	52	60	1	27	39
7	4	0	41	55	62	3	33	89
8	5	0	46	67	58	3	32	51
9	5	2	31	24	6	8	61	24
10	4	0	34	18	37	6	34	54
11	3	7	28	20	9	1	36	50
12	2	21	11	73	2	4	36	57

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.
- 5, Midland Counties; 6, England, S.
- Principal Grazing Sc. Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending February 15th, is furnished from the Meteorological Office:—

"The weather was fine during the earlier half of the week, but subsequently became cloudy and unsettled, with heavy falls of rain in the southern and eastern portions of the kingdom. Snow or sleet fell in many parts of Great Britain on the night of the 14th or on the 15th.

"The temperature has been below the mean, the deficit ranging from 2° in 'Scotland, N.,' 'England, N.E.,' and the Channel Islands to 5° in the western and central parts of England. The highest readings were observed between the 10th and 12th, when the thermometer rose to between 47° and 51° in most districts; in 'England, N.E.,' however, it never exceeded 44°.

The lowest readings, which were recorded on very irregular dates, ranged from 12° in 'Scotland, E.' (at Braemar), 18° in 'Scotland, N.,' and 19° in 'Scotland, W.,' to 27° in 'England, N.E.,' and 'England, S.,' and 34° in the 'Channel Islands.'

"The rainfall has been more than the mean in 'England, N.E.,' 'England, E.,' 'England, S.,' 'Ireland, S.,' and the 'Channel Islands,' but less elsewhere. In the western parts of Great Britain the aggregate fall has been very slight.

"Bright sunshine has been, upon the whole, far less prevalent than was during the preceding week. The percentage of the possible amount of duration ranged from 11 in 'Scotland, W.,' and 13 in 'Scotland, W.,' to 49 in 'Scotland, N.,' 43 in 'England, E.,' and 49 in the 'Channel Islands.'

MARKETS.

COVENT GARDEN, February 20.

[We cannot accept any editorial responsibility for the submitted reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Etc.]

No alteration. Business very quiet. James Webber, Wholesale Apple Market.

POTATOES.—Supply of all Potatoes continue plentiful, and market has tendency to fall. Fresh arrival of Canary new potatoes.—Price from 16s. to 22s. J. B. Thomas.

SEEDS.

LONDON: Feb. 19.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report to-day's market thinly attended. No great activity is as yet exhibited in the trade; the larger provincial houses have already purchased, whilst the smaller country dealers seem generally disposed to postpone their operations as long as possible. Trefoil meets with continued favour, the late rise being well sustained. Red Clover seeds, both English and foreign, is unchanged. White Clover seed moves off slowly on former terms. Of fine Alsike the supply is short. Rye-grasses are exceedingly cheap. Winter Tares fairly brisk. Bird seeds unaltered. Blue Peas steady.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter), for the week ending February 15:—Wheat, 28s. 8d.; Barley, 31s. 8d.; Oats, 18s. 7d. For the corresponding period in 1889:—Wheat, 26s. 6d.; Barley, 26s. 9d.; Oats, 16s. 5d.

FRUITS AND VEGETABLES.

SPITALFIELDS: Feb. 19.—Very good supplies of fresh vegetables and Potatoes. Limited supply of English and foreign fruits. Demand exceedingly slow for the former, but good for fruit. Prices:—English Apples, 4s. to 7s. per bushel; American do., 18s. to 24s. per barrel; forced Rhubarb, 1s. 3d. to 2s. per dozen bunches; natural do., 1s. 6d. to 2s. 6d. do.; Savoy, 1s. to 2s. per tally; Cauliflowers, 4s. to 8s. do.; Greens, 2s. 6d. to 5s. 6d. do.; Seakale, 1s. to 1s. 6d. per punnet; Curley Kale, 4d. to 6d. per bushel; Spinach, 4d. to 1s. per bushel; Brussels Sprouts, 1s. to 6d. per half-sieve; Turnip-tops, 1s. 6d. to 2s. per sack. Sprouting Broccoli, 6d. to 9d. do.; do. 3d. to 4d. per sieve; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; Carrots, 1s. 6d. to 2s. do.; Parsley, 2s. to 3s. 6d. do.; Horse-radish, 1s. to 1s. 4d. per bundle; Celer, 1d. to 1s. do.; Parsnips, 1d. to 8d. per score; Beetroot, 3d. to 6d. per dozen; Endive, 1s. 6d. to 2s. do.; Leeks, 1s. to 1s. 3d. do.; Mustard and Cress, 1s. to 1s. 6d. per dozen baskets; English Onions, 10s. to 11s. per cwt.; Spanish do., 1s. 6d. to 10s. 6d. per case; Bordeaux do., 6s. to 7s. 6d. do.; Belgian do., 7s. to 7s. 6d. per bag of 110 lb.; Dutch do., 7s. to 7s. 6d. do.; Carrots, 16s. to 21s. per ton.

STRAFORD: Feb. 18.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Savoys, 5s. to 5s. per tally; Turnips, 2s. 5s. to 3s. per ton; Carrots (household), 30s. to 40s. do. (cattle feeding), 20s. to 25s. do.; Mangels, 14s. to 18s. do.; Swedes, 13s. to 16s. do.; Onions, English, 10s. to 11s. 6d. per bag; do. Dutch, 4s. to 7s. do.; Apples, English, 2s. 6d. to 7s. 6d. per bushel; do. American, 18s. to 30s. per barrel; Watercress, 6d. per dozen; Celery, 4s. to 10s. per dozen rolls; Rhubarb, 1s. 9d. to 2s. per dozen bundles; Sprouts, 1s. to 1s. 6d. per half sieve.

POTATOES.

BOLINGH AND SPITALFIELDS: Feb. 18.—Quotations—Regents, 40s. to 50s.; Magnums, 40s. to 50s.; Black land, 40s. to 50s.; Bedford, 40s. to 55s.; Lincoln, 45s. to 60s.; Yorks, 50s. to 70s.; Scotch, 50s. to 100s.; Imperator, 40s. to 70s. per ton.

SPITALFIELDS: Feb. 19.—Quotations—Magnums, 40s. to 55s.; Regents, 50s. to 75s.; Champions, 40s. to 60s.; Imperator, 40s. to 70s.; Hebrons, 40s. to 55s. per ton.

STRATFORD: Feb. 18.—Quotations:—Scotch Magnums, 50s. to 75s.; do. Regents, 50s. to 70s.; do. English, light, 45s. to 65s.; do., dark, 40s. to 45s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 73s. to 96s.; do., inferior, 46s. to 75s. Best hay, 60s. to 96s.; do., inferior, 26s. to 50s. Straw, 26s. to 38s. per load.

NOTICES TO CORRESPONDENTS.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ADDRESS.—Will Mr. W. H. Aggett, who sends communications to us, kindly say where he resides, not necessarily for publication, but as an earnest of good faith.

ALDER, ROOT-GALLS: J. W. Not uncommon. There are two forms—one caused by a fungus, the other by a mite.

APPLE STOCKS: F. Y. See *Gardeners' Chronicle*, March 9, 1889, p. 296, where will be found an account of the various stocks employed.

BOOK ON TREES AND SHRUBS: E. S. *Handbook of Hardy Trees, Shrubs, and Herbaceous Plants* (Decaisne, Naudin, and Hemsley), Longman & Co., London.

BOOKS: *Ajar*, Get Ilenfrey's *Elementary Course of Botany*, by Dr. Masters (published by Van Voorst).

BRYOPHYLLUM CALYCINUM: D. E. Peg the leaves on to the surface of moist soil in gentle heat, and you will find small buds originate from the edges.

BULB MITE: J. Marshall. The bulb of Eucharis sent by you is infested by the mite.

CATTLEYA HERMISEANA: T. L. C. Liverpool. This often appears with imperfectly developed flowers, similar to those you send. This may be partly because the plant is not yet well established with us, and partly on account of its flowers being produced in our dull season. It is distinct from C. Skinneri parviflora, but what its relation to typical C. Skinneri may be has not yet been fully determined. This and several others which botanists might consider simply varieties of C. Skinneri are amply distinct for garden purposes. It is better to persevere in the tolerably cool treatment you give. The plant will doubtless behave better next year, and would not have done better with more heat.

CORRECTION.—"Earliness of Vegetation in the Scilly Islands," on p. 207 in our last issue, for "H. Tonsem," read Mr. J. C. Tonkin.

CRICKETS IN THE GREENHOUSE: A. G. G. Try putting diluted carbolic acid into their haunts; it will drive them away. Killing them is labour in vain!

CURRENT BUD MITE: D. B. The numbers are out of print. Unfortunately, you can do nothing but burn affected shoots. Encourage the tom-tits.

FRUIT-FARMING IN ESSEX: D. D. We cannot advise you, as the circumstances are so varied; but this we may safely say—do not put all your eggs in one basket, but let all your eggs be of the first quality.

HALL FOR HORTICULTURE: An Alarmed Fellow and many others. The Society, being scarcely out of the frying-pan, will hardly, as such, commit itself to any such folly as is supposed. The scheme, as we understand it, leaves the Society, in its corporate capacity, quite free.

LANDSCAPE GARDENING: P. Wherry's *Ornamental*, published in 1770, was the first complete treatise on landscape gardening.

NAMES OF PLANTS: J. K. Toxicophila Thunbergii.—G. R. T. Odontoglossum triumphans. D. E. Bryophyllum calycinum.

ORCHID FLOWERS DYING: Secretary. We cannot say for certain what may have caused the flowers sent to turn yellow, but it may probably have been caused, as you suggest, by an escape of coal-gas.

ORCHID PEAT: R. M. Not a good sample for the particular purpose, though otherwise it is good. Knock out as much of the soil as possible from the lumps.

PAPER POTS: Somerset. We do not know. The makers should advertise.

PACKING FLOWERS FOR LONG JOURNIES: Florist. Pack in boxes not more than 2 inches deep, 1 foot wide, and 1 foot 8 inches long. These should be made to fit into a light crate easily, but without movement. Use no wadding in the boxes amongst the flowers. Very choice things may be wrapped singly in thin tissue paper, and very clean live moss used to separate things. Many kinds of flowers travel with the least amount of injury in buches of ten to twenty blooms, notably Narcissus, Tulips, Freesias, and the like. Camellias, fine Rose blooms, Gardenia, Eucharis, Stephanotis, Allamanda, travel best when embedded singly in the moss. Strew moss lightly over all, or place tissue paper. Pack with a moderate degree of firmness.

SHELLAC FOR FLORISTS' GUM: Shellac. The formula you give is a proper one, but perhaps it was not allowed to remain sufficiently long in a warm place; or, the spirits used were too much diluted. Use strong methylated spirit.

TUBEROUS BEGONIA: H. J. The tuber may be shaken out of the old soil; the old roots trimmed off and repotted, burying two-thirds of the tuber; soil light, rich, somewhat sandy. The tuber may then be put into a pit or house, with a night temperature of 55°, with 10° to 15° rise in the day time. Do not give any water if the soil is moist; and water carefully, and only when it is very dry. When young shoots appear, and are 2 to 3 inches long, any of these taken off with a very thin layer of the tuber will strike in sandy soil in heat under a bell-glass or case. Keep the mother plant in warmth, and near the glass, until June, when it may be planted out-of-doors; or it may be kept in a pot, and receive slight shifts as may be required.

ZONAL PELARGONIUM: T. E. B. The appearance is due to over-feeding. There is nothing to fear.

DIED.—At 5, South Street, Halifax, Nova Scotia, February 5, CAROLINE MATILDA LAWSON, beloved wife of George Lawson, Professor of Chemistry, Dalhousie College, and daughter of the late William Jordan, Halifax.

A PROLIFIC VINE.—Two thousand two hundred bunches of Grapes on a Vine tree have, according to the *Grazer Zeitung*, been counted at Wilton in Styria, Austria, by a special commission. The Vine is twenty-two years old, and divides 7 feet above ground into five branches, which, resting on a wire frame, cover a courtyard measuring about 140 square feet. The Vine is an Isabella, a variety of Labrusca.

FOR PLANTS. QUICK. LASTING. ECONOMICAL.

This is a Plant Food of great excellence, carefully prepared with the view of supplying a manure which shall contain all the elements necessary for the Perfection of Plant Life, and at the same time be QUICK IN ACTION, LASTING, AND ECONOMICAL.

The ingredients have been so arranged that, whilst accelerating luxuriant growth, permanent benefit is secured by a continuance of nourishment to the plant.

It is safe in use, and suitable for every purpose where a manure is required.

Sold by Stockmen, Florists, and Nurserymen, in 6d. and 1s. Packs, and 1s. SEALED BAGS:— 7 lbs. 14 lbs. 28 lbs. 56 lbs. 112 lbs. 2s. 6d. 4s. 6d. 7s. 6d. 12s. 6d. 20s. The above Trade Mark is printed on every Packet and Bag, and also impressed on the Lead Seal attached to the mouth of each Bag.

A SAMPLE PACKET will be sent post-free, on receipt of 1s. by the MANUFACTURER.

New Pattern Tree Guard, "THE PORCUPINE."

The maximum of utility and the minimum of cost. Constructed of strong Iron Uprights and Galvanized Barbed Steel Wire.

Price, 10s. 6d. each.

TESTIMONIALS.
The Gardens, The Whittier, Kingston, Feb. 9, 1888.
Dear Sirs,—The 100 Barbed Wire Tree Protectors you sent to Mr. Green's order I have now fixed to the trees, and I feel bound to say that I never saw anything in the shape of a tree-protector equal to them. I think I shall be able to add further testimony after the cattle are turned out in the spring.
—Yours faithfully, J. WEARING.
The Gardens, The Whittier, Kingston, Sept. 28, 1888.
Gentlemen,—The 100 Porcupine Tree Guards you supplied to Mr. Green's order have proved a great success—in fact, they are the best I ever saw. These guards stand well against the trees, therefore cattle cannot, and will not, attempt to reach the branches. I would strongly recommend anyone who contemplates planting trees, and wishes to know which is the best guard to use, to give pattern "C" a trial.
Yours faithfully,
J. WEARING.

Messrs. Hill & Smith.

THE GARDENERS' CHRONICLE

Scale of Charges for Advertising.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, W.C., unless the order is of a Postal Order known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST OFFICE MONEY ORDER.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the number in connection with which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested, when Remitting, to give their Name and Address, and also a Reference to the Advertisements which they wish renewed.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—JOHN DOWNE, Seedman, 41, Prince Street, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents—STEWARDS, BAILIFFS, or GARDENERS.—JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. CARTER. Enquiries should be made to 23 and 253, High Holborn, W.C.

Gardeners, Foresters, and Land Stewards. R. every confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

Gardeners, Foresters, and Farm Bailiffs. LITTLE and BALLANTYNE, The Queen's Nurserymen and Seedsmen, Carlisle, invite correspondence with Land and Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, or LAND STEWARDS. Their extensive business relations throughout the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

HEAD GARDENERS.—At the present time I can recommend several highly respectable MRN. of known ability and good character.—THOS. BUTCHER, Seed Merchant, Croydon.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

HOLLOWAY'S OINTMENT and PILLS.—Counsel for the Debauched.—Those to whom the changeable temperature is a protracted period of trial, should seek the earliest opportunity of removing all obstacles to good health. The cooling Ointment, perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quinsey, relaxed tonsils, sore throat, swollen glands, ordinary catarrhs, and bronchitis, usually prevailing in this season, may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment. This Ointment and Pills are highly commended for the facility with which they successfully contend with influenza; they ally in an incredibly short time the distressing fever and teasing cough.

Purchasers of TREES, AND EVERGREENS should send for our special offer. DICKSONS Nurseries, CHESTER.

ECHINOCEREUS CANDICANS. THE RAINBOW CACTUS.

As we possess an enormous stock of this beautiful, rare and costly Cactus, we are prepared to offer it at a great bargain. The plant is covered with a network of spines which range in color from creamy white to deep crimson, hence its name "Rainbow." It is the most beautiful plant at all times, but when in bloom its grandeur is unsurpassed, having flowers 4 inches across, bright crimson with a white center. It blooms profusely and is of the easiest culture in pots and is hardy in the open border. Price of strong sample plants for immediate delivery, 5s., and 1s. each, according to size, by mail post paid. Remitt. by Postal Note or Order. To every order we will add a packet of the WONDERFUL WEATHER PLANT gratis. OUR CATALOGUE Seeds, Bulbs, Plants and Rare Fruits is the most magnificent ever issued. 116 pages profusely illustrated, and four large colored plates and colored covers. We offer the finest novelties in Flowers, Vegetables and Fruits, notably: our great Japanese Wmberg, Jewel Dahlia, Mary Washington Rose, Fruit Tomatoes, Cyvas, Hardy Orange, Tree Currant, Bush and Poppies, etc. Also the grandest collection of flowering shrubs and rare Cacti. This elegant and expensive Catalogue will be sent free to all applicants. We deliver all goods to any part of the world, carriage paid. Write at once, as this offer may not appear again. Address: JOHN LEWIS CHILDS, FLORAL PARK, QUEENS CO., N. Y., U. S. A.

WEBBS'

DELIVERED FREE. NEW TOMATO. IMMEDIATE DISPATCH.

"SENSATION."

The finest variety extant. See Testimonial below.
1s. 6d. and 2s. 6d. per Packet, Post Free.

From Mr. GEO. HAWKINS, *Gardener to Col. Tuberville, Evesham Priory, Gloucestershire.*
"Last year I grew your Tomato season in pots, and it gave me such satisfaction that this year I grew it out-of-doors, in different places and aspects, and it has done wonderfully well in every place. I never had a Tomato to fruit so freely, and such large fruit, without any thinning. I put fifteen plants on the wall outside one of our pits; the wall is 3 feet 6 inches high, and 50 feet long, with a border only 8 inches wide. I had patched some ripe fruit, and I counted the remainder—there were 670 fruit—and twelve of them weighed 8 lb. 10 oz."

WEBBS' SPRING CATALOGUE
Post-free, 1s. Abridged Edition, Grates to all.

WEBB & SONS, WORDSLEY, STOURBRIDGE

THE BEST TABLE

CUCUMBER.

CARTERS' CARDIFF CASTLE.

POTATO DANIELS

THE MOST WONDERFUL CROPPING POTATO IN THE WORLD.

Price 2s. 6d. per peck, 8s. per bush, 21s. per sack. Much cheaper by the ton.

EVIDENCE OF SUPERIOR QUALITY AND PRODUCTIVENESS.

From Hundreds of Unsolicited Testimonials received we select the following:

From Mr. H. HAMMERSON, Woodborough, August 14, 1889.
"I have had the honour of winning the SILVER Cup offered at our show for the best collection of Potatoes. I sowed 123 varieties, 68 of which I had direct from you. I grew 147 varieties, and the best cropper by far was THE DANIELS."

Quantity Planted, 14 lb. Quantity Raised, 725 lb. From the "KETTERING GLEANER."

REMARKABLE POTATO YIELDS—Mr. G. Johnson, of Wadcroft, has a crop of Potatoes remarkable both for size and quantity. He purchased 14 lb. of THE DANIEL seed from Messrs. Daniels Bros., Seed Growers, Norwich, and the 14 lb. of seed yielded no less than 725 lb."

Before ordering, send for Daniels' New Potato Catalogue, containing Coloured and other Illustrations, and much valuable information. Grates and post free to all.

16, 18, & 20, DANIELS BROS., Exchange Street, NORWICH.

Save 15 to 25 per Cent. by purchasing BEST QUALITY OF... J. E. BARNES, Seed-grower and Seedsmen, Exchange Street, Norwich.

SUTTON'S SCARLET RUNNER BEAN.

Of the many types of Scarlet Runner this is decidedly the best. The pods have a smooth and silky surface, and as they grow perfectly straight and to a great length, they are very attractive on the exhibition table. Both in hot and dry, and also in cold and wet seasons, this Bean has yielded remarkable results.

Your Scarlet Runner is the best I have ever grown. Some of the spikes produced from ten to fifteen. Beans, many of which were 10 inches long.—Mr. F. SHERRIFF, *Gardener to H. Cox, Esq.*

Price of Seed, 3s. 6d. per Quart.

SUTTON'S ABUNDANCE RUNNER BEAN.

Although the individual pods are frequently 12 to 16 inches long they are produced in extraordinary abundance, and have the same smooth appearance as Dwarf French Beans. Exceedingly tender when cooked and very early.

"We have pods 11 inches in length, and abundance of them. The quality is of the best, being tender even when the pods look old.—Mr. W. WELLSMITH, *The Gardens, Heston.*"

Price of Seed, 3s. 6d. per Quart.

SUTTON'S SEEDS

GENUINE ONLY FROM SUTTON & SONS, READING.

SPECIAL CULTURE OF FRUIT TREES AND ROSES.

A Large and Select Stock is now offered for Sale. The Illustrated and Descriptive Catalogue of Fruits post-free.

WATKINS and SIMPSON, Seed and Bulb Merchants, Exeter Street, Strand, London, W.C.

whom a copy had been sent, declared that the figures were prettier and more accurate than any that had been seen since the foundation of the world. Here are his words: "Donum tuum operis immortalis charioris veniet pretio quam, ut id remunerare valeam. Figure enim sunt et pulchriores et accuratiores quam ulle quas vidit mundus a condito orbe." In several other letters the great Swedish botanist speaks most highly of the quality of Miller's work, and stated that he should be under everlasting obligation to the author for so magnificently illustrating his classification of plants. Without going so far as to say that Miller was unsurpassed, even by his contemporaries, it may safely be asserted that much of the work of the present day is far behind him, and he will always rank as a master.

The plants selected for the purpose are mostly common ones, in order to render the book useful to persons who had not access to the rarer plants of botanic gardens and large private gardens; and the arrangement is, of course, after the Linnean classes and orders, beginning with *Canna indica*, to represent the Monandria monogynia, followed by *Blitum virgatum*, referred to the Monandria digynia, though it is now known that the stamens vary in number from one to five. Each class and order is taken in its turn, and some of the plates are most elaborate productions, exhibiting an amount of detail that is truly surprising, both in the drawing of the plant itself, and the number of dissections.

Although the object was to choose common plants, such comparatively little known subjects appear as *Hamamelis virginica*, *Turnera ulmifolia*, *Petiveria aliiacea*, *Galenia africana*, *Cassytha baccifera*, *Meli-anthus major*, *Pentapetes phoenicea*, *Hermannia alnifolia*, and *Momordica charantia*.

Specially effective among commoner plants are the Sunflower, Hollyhock, common Marigold, a single Peony, Blackberry, Apple, Fig, and the common Passion-flower. The figures of the Sunflower and single Hollyhock are really admirable pictures, representing the flowers of the natural size, the Sunflower being 8 inches across.

The common Hop, *Sarracenia*, and the little *Aloxa*, are conspicuous examples of failure, the last being represented with 20 to 30 flowers in a cluster, and the others were evidently not drawn from living plants.

I have mentioned that the Beutham trustees had presented Kew with both a coloured and an uncoloured copy. This is hardly true, because the coloured copy wants the letterpress, and the four plates representing the forms of leaves. What is wanted is more than compensated for, however, by the fact that the plates are "proofs before lettering," most carefully coloured, and probably unique!

I believe the volumes, which are lettered I. and II. formed part of the library of the late Mr. Lee, of the Vineyard, Hammersmith. The original James Lee, if I may so designate him, who was born in Scotland in 1715, and died at Hammersmith in 1795, was a botanist as well as a nurseryman, ranking with Miller, Gordon, and Aiton; and his name is amongst the list of subscribers to John Miller's book. Miller died in 1780, and it is probable that Lee acquired the coloured copy subsequently, as it has the appearance of being an author's copy. Lee himself was author of a highly esteemed *Introduction to Botany*, which went through five or six editions, of which I have seen only the first.

Returning to the list of subscribers, it is interesting to find David Garrick's name associated with many so much better known as lovers or patrons of botany. Altogether there were eighty-two subscribers, taking about 125 copies.

Two German editions of the *Illustration* were published, one at Darmstadt in 1790, and the other at Frankfort-on-Maine in 1804. Both were coloured, and the latter sold at 76 thalers, or about £11.

Miller also published an octavo edition of the *Illustration of the Sexual System* in 1773, and a

second volume illustrating botanical terminology. There was a German edition of this work, of which I have seen only the second volume. This consists almost entirely of the floral dissections of the larger work.

At Kew there is a copy of all that was published of an earlier folio work (1759-1760), of which there is no title-page, but only an advertisement worded as follows:—"Proposals for publishing one hundred prints, exhibiting a curious collection of insects and plants. By John Miller, Engraver." Only ten plates were published, and the explanatory letterpress as far as the eighth plate. In the Kew copy the ninth and tenth plates are in duplicate, somewhat differently lettered, and the descriptions are in manuscript. It is not surprising that this elaborate and beautiful work was not carried beyond the tenth plate, for it must have been a most costly production. It equals, if it does not surpass Euret's *Plante et Papillons*, which appeared earlier, and probably furnished the idea for it. The price was 5s. a part each part containing two plates and letterpress; and Miller states in a footnote to the advertisement that if he met with encouragement in the undertaking, he proposed going through the whole animal creation, according to the system adopted by Dr. Linnæus. Most of the plates contain representations of two or more different plants in flower and fruit, and various moths, butterflies, and other insects preying upon them, and depicted in a variety of positions and stages. To say nothing of the original work, the colouring of a plate must have occupied a person from one to two days. The Apple, Gooseberry, Grape, Jasmine, Dead-Nettle, and Lilac, with the caterpillars of the hawk, peacock, swallow-tail, and other moths and butterflies, are among the subjects illustrated.

In the same volume is a fine coloured large folio engraving of the Tea-shrub, with a page of letterpress. The drawing was prepared from a plant that flowered in the Duke of Northumberland's garden at Ston House in 1771, and was published by Miller in the same year, apparently in a separate form.

An uncoloured engraving of the Coffee-shrub accompanies it, but the only lettering on it is "J. Miller, Sc."

Finally, there is a copy, in the same volume, of John Miller's last work—a fragment of an ambitiously designed *Icones Plantarum* that only reached the seventh plate, when death overtook the artist. In this work, also, some of the plates in the Kew copy are represented by unlettered proofs, as well as the published plates. The plants figured are *Sophora tetraptera*, *Phormium tenax*, *Sturtia virginica*, *Fothergilla alnifolia*, *Strelitzia regina*, and *Lagerstrœmia indica*; and most of them were drawn from plants that flowered at Kew. *W. Botting Hemsley*.

LIST OF GARDEN ORCHIDS.

(Continued from p. 167.)

LELIA.

L. × Batemaniana, Rehb. f. = *SOPHRO CATTLEYA* × *BATEMANIANA*.

L. × bella, Rehb. f. = *LILIO-CATTLEYA* × *BELLA*.

Chron.*, 1848, p. 403, with fig. *Bletia lobata*, Rehb. f., in *Walp. Ann. Bot.*, vi. (1861), p. 424 (also *E. Boothiana*, Rehb. f., in note). *Lelia Rivieri*, Carrière, in *Rev. Hort.*, 1874, p. 331, with plate. *L. lobata*, Veitch, *Man. Orch. Pl.*, pt. 2 (1887), p. 74, with fig. *L. grandis purpurca*, Rehb. f., in *Bonplandia*, ii. (1854), p. 89.—Brazil. Imported by Messrs. Loddiges, of Hackney, and flowered in their nursery in 1847, when it was described by Dr. Lindley as *Cattleya lobata*. Afterwards it was described as *Lelia Boothiana*, by Reichenbach, from a plant in the collection of Herr Lorenz B oeth, of Flotbeck, near Hamburg, where it had existed for

many years without flowering. It appears to be only known from one station on the coast of Rio de Janeiro, where it is said to grow on a bare rock that is washed by the ocean below, and where it is fully exposed to the sun from morning till night. It is probable, however, that it grows in other localities in Southern Brazil.

(5.) *L. CINNAMOMEA*, Bateman, ex Lindl., *Sert. Orch.* (1838), t. 28; *Paxt., Mag. Bot.*, vii., p. 193, with plate; *Bot. Mag.*, t. 4302; *Garteflora*, 1853, t. 559; Warn. and Will., *Orch. Arb.*, vii., t. 314; *Orchidophile*, 1888, p. 357, with plate. *Bletia cinbarrina*, Rehb. f., in *Walp. Ann. Bot.*, vi. (1861), p. 430.—Brazil. Native of the southern part of the province of Minas Geraes, and the adjacent parts of the province of Rio de Janeiro, at an altitude of 2500 to 3500 feet, growing on the rocks, half concealed by the herbage. It was introduced by Mr. Young, a nurseryman of Epsom, in whose establishment it flowered during the following spring. *Bletia cinbarrina* var. ? *Sellowii*, Rehb. f., *Yen. Orch.*, ii., p. 61, to which *Bot. Mag.*, t. 4302, is somewhat doubtfully referred, does not appear to me to present any obvious difference from the typical form, and is therefore here ranked as a simple synonym.

Var. *CRISPILABIA*, Veitch, *Man. Orch. Pl.*, pt. 2 (1887), p. 63. *L. crispilabia*, A. Rich., ex Warn., *Sci. Orch.*, ser. 2 (1865-75), t. 6. *L. Lawrenceana*, Hort., ex Warn., *Sci. Orch.*, ser. 2, sub t. 6. *Bletia crispilabia*, Rehb. f., *Yen. Orch.*, ii. (1872), p. 61.—Flowers amethyst-purple, instead of cinnamon-red, lip somewhat deeper in colour, and with the disc of the front lobe white.

(6.) *L. CINNAMOMEA*, Rehb. f., in *Hamb. Gartenz.*, xvi. (1850), p. 180. *Bletia cinbarrina*, Rehb. f., *Yen. Orch.*, ii. (1872), p. 47.—Brazil. Appeared in the collection of Consul Schiller, of Hamburg. Only known to me by a very rude tracing in Lindley's Herbarium. It may be a natural hybrid, as the pollen-masses are described as unequal; the segments cinnamonaceous-cupreous, the lip white, with purple nerves at the base, and the front lobe purple. The lip is strongly 3-lobed, the lateral lobes semi-ovate, and the front one rhomboid and obtuse.

(7.) *L. CRAWSHAYANA*, Rehb. f., in *Gard. Chron.*, 1883, pt. 1, p. 142.—Mexico. A supposed natural hybrid, which appeared in the collection of Mr. De B. Crawshaw, of Rosefield, Sevenoaks, Kent, after whom it is named. It is probably a natural hybrid between *L. albidia* and *L. anceps*, though at first it was supposed to be between the latter species and *L. autumnalis*.

Var. *LEUCOPTERA*, Rehb. f. = *L. LEUCOPTERA*.

(8.) *L. CRISPA*, Rehb. f., in *Fl. des Serres*, ix. (1853-4), p. 102; Veitch, *Man. Orch. Pl.*, pt. 2, p. 63, 64, with fig. *Cattleya Crispa*, Lindl., *Bot. Voy.*, xiv. (1828), t. 1172; *Paxt., Man. Bot.*, vi., p. 5, with plate; *Bot. Mag.*, t. 3910; Hook., *Cent. Orch.*, t. 32; Rehb. f., *Fl. Esch.*, t. 298; *Garteflora*, t. 574; *Belg. Bot.*, 1854, p. 161, with plate (var. *reflexa macrorhyncha* in text, var. *pendula* in plate). *Bletia crispa*, Rehb. f., in *Walp. Ann. Bot.*, vi. (1861), p. 423.—Brazil. Grows on lofty trees fully exposed to the sun and air, and sometimes even on rocks, in immense masses on the mountains near Rio de Janeiro, also in the southern parts of the province of Minas Geraes, at an elevation of 2500 to 3500 feet. It was one of the first *Lælias* cultivated in Great Britain, having been sent to the Horticultural Society of London in 1826 by Sir Henry Chamberlain. It flowered at Chiswick in August of the following year. The following varieties have been described:—

Var. *BUCHANANIANA*, Veitch, *Man. Orch. Pl.*, pt. 2, p. 64. *Cattleya crispa Buchananiana*, T. Moore, in Warn. and Will., *Orch. Arb.*, ii., t. 81. A large flowered form, with the front

lobe of the lip broad and open, and of a rich purplish-crimson.

Var. DELICATISSIMA, Rehb. f. in *Gard. Chron.*, 1881, pt. 2, p. 354. *Cattleya crispifolia*, Williams, *Orch. Gr. Man.*, ed. 6, p. 177. A form in which most of the colour has vanished from the lip, leaving the flower nearly white.

Var. PTEROPREA, Warn., *Select Orch.*, ser. 2, t. 9. *Cattleya crispa purpurea*, Williams, *Orch. Gr. Man.*, ed. 6, p. 178. *Elvira crispa purpurea*, Rehb. f. *Yeu. Orch.*, ii., p. 52. A large-flowered form, in which the sepals and petals are tinged with blush, and the lip blotched with deep purple, which runs out into radiating lines near the margin.

Var. REFLEXA, Rehb. f. in *Fl. des Serres*, ix., p. 102; *Cattleya reflexa*, Id., in *Bonpl.*, ii., p. 89. *Cattleya reflexa*, Parmentier, ex Rehb. f. in *Fl. des Ser.*, ix., p. 102. *Cattleya crispa var. reflexa macrophylla*, D'Engelm., ex C. Morr., in *Bola. Hort.*, 1854, p. 161 (var. *pendula* on plate). *Elvira crispa reflexa*, Rehb. f. *Yeu. Orch.*, ii., p. 52. According to Reichenbach, this differs from the type in having the blotches near the base of the lip orange-yellow instead of citron-yellow, though I cannot see the difference in the figure here cited.

Var. SPERDINA, Warn., *Select Orch.*, ser. 2, sub t. 9. *Cattleya crispa sperdina*, Williams, *Orch. Gr. Man.*, ed. 6, p. 178. A large-flowered form, with the lip much fringed and brilliantly coloured.

L. CRISPILABIA, A. Rich.—L. CINNABARINA var. CRISPILABIA.

L. DAYANA, Rehb. f. = L. PUMILA var. DAYANA — R. A. Rolfe, *Hebrarium*, Kew.

(To be continued.)

LONGEVITY OF FERN SPORES.

IN the *Gardeners' Chronicle* of August 3 last year, p. 140, is a short article on the above subject, the gist of which is, that "after several inquiries had been made to him as to whether he knew how long Fern spores would retain their vitality, he determined to experiment on the subject, the result of such experiment being that spores that were gathered in 1886 retained their vegetative powers up to that time, a period of three years." Since that article was written, I have sown some spores which had been gathered and kept dry for six years, so that possibly they will retain their power of germination for long periods of time. Perhaps it may be interesting to some of your readers to know how I came to have Fern spores so long in my possession, and why I, not being altogether an experimentalist (though every gardener should be one) should have been induced to try the experiment.

In August, 1883, I was visiting a little place called South Knighton, between Newton Abbot and Ashburton, about 1 mile from the latter place—I was there on a holiday tour—when, in strolling about the place, I came to a lane with a stone wall on either side, on which I saw a number of small Ferns growing; stopping to examine them, I found a quantity of *Asplenium trichomanes*, and also *A. rutamuraria*. Scanning the wall more intently, I found a single root of *A. Ceterach*, or *Ceterach officinarum* (the scaly Spine-wort). I had never previously seen it growing wild, but there was no mistaking its pretty little fronds. As I was going to be some days longer away from home, I did not take the root up, as I should have done if I had been returning at once, but picked off the only two fronds it had, and put them in my pocket-book, making at the time a note of the situation in which it was found. After I got home I fastened them upon a sheet of paper, and put them away in a desk, and thought no more of them until last August, when I again went into the same neighbourhood, and as I had resolved before I left home that I would try and find my *Ceterach*, so I searched for the plant, but in vain—it was not to be found, nor any of its kind; and, search as I would, my search was hopeless, so that I lamented not having secured the root when I first saw it; but I had read the article referred to previously, so I

determined to hunt up the fronds I had, and see if they had any spores. One of the fronds had become detached, and was not to be found, but the other seemed to be pretty well stored with fructification. As a preparation to sowing, I filled a 3-inch pot nearly to the rim with good loam, and after giving it a good watering, I covered the surface with a little powdered charcoal, then taking the tiny frond (not more than an inch in length) in one hand, and a knife in the other, I scraped off the scales with the spores from the back of it upon the powdered charcoal, covered the pot with a piece of glass, and put it in a moist heat of about 65°. After having been sown about three weeks or a month, there began to be shown signs of life, and the soil has now become entirely covered with the first green development of the young Ferns, and I am hoping that if all goes well, to get several plants from it. I am not a specialist in Ferns, nor a large grower of them, but I am a great admirer of them; and nothing I think presents so much chaste beauty as a lot of well grown Ferns, even if they are growing wild, and a bank of Ferns is worth walking a mile or two to see. I remember some years ago, when in Cornwall, seeing a large bank completely covered with fine specimens of the Lady Fern, and the effect was truly delightful. It has been noted that there is a growing tendency in the public taste for the beauties of the floral kingdom; and running side by side, is the taste for the beauties of Ferns. W. H. Blackmore, *Weymouth Gardens*, Exeter.

LONDON SUBURBAN MARKETS.

DURING a period of some three years there has grown up on the broad road area on the Middlesex side of New Bridge, a kind of impromptu vegetable market, and the thing has of late become so extensive that the attention of the local authorities has been drawn to it in such a way as must shortly lead to some change for the better. The market has been composed of laden vans and carts coming from west Middlesex and parts of Surrey, which have of necessity to concentrate at that particular spot on their way into London. Originating with a little cart-tail trade, with a few local dealers, it grew so considerably that now, on Monday, Wednesday, and Friday mornings, some sixty to seventy vehicles, heavily laden with vegetables, and, in the proper seasons, with fruit and flowers also, may be found congregated at this particular spot. No wonder that traffic of an ordinary kind has been materially interfered with.

This particular market is not made up of the ordinary Covent Garden consignments, which pass up during Monday, Wednesday, and Friday nights, ready for the market of each succeeding morning. Large numbers of market growers do not send to Covent Garden at all; they have all over the west side of London a big shop trade, done on the mornings which are not sacred to Covent Garden. The New Bridge market purchasers are made up chiefly of shopkeepers and dealers from the most populous of the western suburbs, who have, in this meeting all the market vans, ample opportunity to select from any of the best and cheapest rather than to put up with what only one or two calling vans may furnish. They also have the advantage of trading in a convenient locality, and under less pressure than is found in Covent Garden. As this impromptu market is held in the district of the Brentford Local Board, that body is the first to take the matter of the provision of a proper public market into consideration. But the Kew market is held also just in the confines of the Chiswick Local Board district, and has better opportunities of providing the needful market area than has the Brentford authority.

But again there is the Middlesex County Council dominating over these local bodies, and were that new, and so far not very active authority, alive to its responsibilities, it would ere now have dealt with the question of the provision of proper suburban markets. Further, some 2 miles or so from Kew Bridge are found the borders of the domain of the

London County Council, and here again we find an authority which does not evince any too much haste to deal with the very important subject of public vegetable markets for London. Were the body to establish one such market at its western border of Hammersmith, it would probably obviate the need for a market at New Bridge; if the Middlesex County Council were to establish such a market at Chiswick, one at Hammersmith would be a superfluity. Whilst the various authorities have been sleeping or inactive, the market growers have been making in a tentative way a market for themselves, and it would seem as if they will have to wait some time yet ere any proper accommodation is furnished for them by the local authorities. The whole subject of providing proper markets for the metropolis requires to be dealt with by Royal Commission, and at once. That these markets should be well into the populous or immediate suburbs of London is evident. Not only should the dealers, but the consumers, have free access to them; whilst the emptied market vans might be reloaded with manure from the district ere they return homewards.

MANURES.

In a previous article upon this subject (p. 714, vol. vi.), we briefly described some of the general properties of the more important ingredients used by plants to increase their growth.

We now come to the questions of manurial supply and demand, believing that an exact and thorough knowledge of every process connected with the physiology of plant life, and the chemistry of plant-food cannot fail to result in economic applications of the most important character.

SOIL FERTILITY.

The stock of fertility which exists in productive garden soils, though generally large, is for the most part in a very insoluble form. For instance, the combined nitrogen which is the product of previous vegetable and organic life, forms the chief source of nitrogen for the future growing plant. Before it is assimilable by the plant, however, this combined nitrogen undergoes a process of oxidation, which is due solely to a living organism within the soil. The nitrates thus formed are absorbed by the plant, when its manuring properties are exceedingly active.

The mechanical operations of ploughing, digging, raking, hoeing, &c., which take place in a garden, have for one of their objects the promotion of oxidation, and the formation of nitric acid. Abundant crops depend very much upon the capacity of the growing plants to take up the few pounds per acre that is produced of this most important ingredient of plant-food, and the skill of the gardener is displayed in so arranging his methods of culture and course of cropping, that the nitrates so liberated shall be a source of profit instead of loss.

Sir J. B. Lawes describes a fertile soil as one which is competent to liberate a considerable amount of active nitrates from its store of combined organic nitrogen; while an abundant season is one in which the crop is enabled to take up an unusual amount of this active nitrogen.

But if the amount of fertility liberated by the bacterial organisms, or nitric ferments as they are sometimes called, were sufficient to produce full crops, there would be no necessity for applying manure; it is quite evident, however, that such is not the case.

Some soils, it is true, require but little aid, owing to their inherent richness; but there are others—more especially those of a light, sandy character—that are almost entirely dependent on the fertility they get from external sources. Practical experience has shown in different districts, and on different classes of soil, what is required to grow full and remunerative crops.

The first problem, therefore, which a gardener has to solve, we take it, is to preserve the present stock of soil fertility, and to increase the accumulation of plant-food for future use. It is true that the stores of mineral food—potash, phosphoric acid, lime, and

the like—in the soil and subsoil of our best garden soils accessible to plants are very great, and it would require many years of cultivation, and removal of crops, to entirely exhaust the supply, yet we may fairly assume that the system of horticulture which leaves the soil in an impoverished condition is certainly not an economic one to follow.

SUPPLY AND DEMAND OF PLANT-FOOD.

There are, doubtless, larger external sources of plant-food supply now at hand, which were quite unknown to a former generation of gardeners, which afford the means of adequate restoration to the soil under a very much less restricted system, both as to cropping and sales of produce, than that which now prevails, and is considered essential for the maintenance of the fertility of our garden soils. In ordinary practice, however, the bulky farmyard or stable manure is very largely relied upon for all crops, and is sometimes applied in very large quantities.

This may probably be accounted for by the fact, not only of the simplicity of its application, but its safety in working. Independently, also, of its liberal supply of all necessary constituents of plant food, the beneficial effects of stable manure are in a considerable degree due to its influence on the mechanical conditions of the soil, rendering it more porous, and easily permeable to the surface roots, upon the development of which the success of so many of our garden crops depend. Then, again, something may be due to an increased temperature of the surface soil, engendered by the decomposition of so large an amount of organic matter as is supplied in 10 or 20 tons per acre of stable manure, which quantity is frequently exceeded in market gardens; whilst the carbonic acid evolved in the decomposition of the dung will, by the aid of moisture serve to render the mineral resources of the soil more soluble.

Let us follow up an instance of frequent occurrence in common market garden practice of manurial supply and demand.

The following table shows us the amount of selected manurial constituents that will be supplied to the soil in 10 tons of ordinary farmyard or stable dung, and the average amount of the same ingredients that will be removed from the soil, by the growth and sale of 10 tons of vegetables as gathered for the market. The vegetables will comprise Carrots, Parsnips, Turnips, Peas, Cabbage, Onions, Beans, and Lettuce.

Selected Chemical Constituents in 10 tons of Farmyard Manure, and in 10 tons of Vegetables, and the difference (+ more, or - less) the Manure than the Produce, in pounds.

	Nitrogen.	Phosphoric Acid.	Potash.	Lime.
In 10 tons farmyard dung	150	80	110	160
In 10 tons of vegetables...	193	33	68	74
Manure more or less than vegetables ...	-73	+47	+41	+126

These figures clearly show that the manure supplies to the soil an excess of mineral ingredients over and above that required by the growth of a corresponding weight of marketable crop, but that the supply of nitrogen, the most expensive of all the manurial constituents, is quite inadequate to the demand, showing in the 10 tons a deficiency of 73 lb.; hence the desirability of supplementing a dressing of dung with 1, 2, or 3 cwt. of some nitrogenous artificial manure.

Further, it is found, in the case of many of our garden crops, that only a small proportion of the nitrogen of farmyard manure is taken up in the year of application. And the Rothamstead agricultural experiments seem to indicate that some plants are able to avail themselves of a less proportion of the nitrogen of the manure than others, and that this is especially so in the case of the Potato; let us, therefore, put this crop to the test of manurial supply

and demand as we have done above for the other vegetables.

The following table shows the amount of four selected manurial constituents supplied to the soil by the application of 10 tons of farmyard manure, and the amount of the same constituents taken from the soil by the growth and removal of 10 tons of Potatos.

Selected Chemical Constituents in 10 tons of Farmyard Manure, and in 10 tons of Potatos, and the difference (+ more, or - less) the manure than the Potatos, in pounds.

	Nitrogen.	Phosphoric Acid.	Potash.	Lime.
In 10 tons farmyard manure ...	120	80	110	160
In 10 tons Potatos ...	80	80	120	15
Manure more or less than Potatos ...	+40	...	-10	+145

We here see how great is the demand the Potato makes upon the mineral resources of the soil, and that potash forms an item of considerable importance in growing this crop, which is not a matter of surprise when we consider how essentially potash is connected with the formation of starch; for this reason farmyard manure, which itself supplies large amounts of potash to the soil, is supplemented by Potato growers with kainit or potash salts.

For the production of garden vegetables generally very large quantities of farm or stable manure are applied, beyond what is required as a mere supply of constituents to the crops; the process being, to a great extent, one of forcing, to which we have already called attention, and a necessary result is a great accumulation of unexhausted residue within the soil.

We learn from statistics given in a recent lecture by Professor J. H. Gilbert, "On the Growth of Potatos," that in some localities where this crop constitutes an important item of production, the quantity of dung used ranges from 12 to 15, and even to more than 25 tons per acre, and sometimes as much as 10 cwt. of artificial manure is used as a supplementary dressing, consisting chiefly of superphosphate or dissolved bones, and potash salts, or kainit.

Seaweed is largely used as a manure on some parts of the coast for the growth of vegetables, and it is found especially suited to the Potato crop which, as we have seen, requires much potash—a large mineral constituent of seaweed.

ATMOSPHERIC RESOURCES OF PLANT FOOD.

It is entirely fallacious to suppose that garden crops, whether flowers, fruit, or vegetables gain a large amount of nitrogenous plant-food from atmospheric sources by means of this extended leaf-surface. The quantity of combined nitrogen brought to the soil and growing plants by rain-water and the atmosphere, is so inconsiderable an amount when compared with the whole weight required by the crop, that we may fairly say, no plants are more dependent on nitrogen in an available condition within the soil than are garden vegetables. No matter how good the normal condition of the soil may be, it will not long produce paying crops of vegetables, or even fruits without manure. Certain it is that if a garden will not pay with liberal manuring, it will not pay without it. *J. J. Willis, Herpenden.*

DACRYDIUM LAXIFLORUM is interesting, says KURR, in his *Forest Flora of New Zealand*, as being the least of all the Conifers, fruiting specimens being sometimes found less than 2 inches in height; usually it is from 6 to 12 inches high. Occasionally it may be found growing amongst other shrubs, and supporting its weak stems among their branches to the height of 3 to 4 feet, but left to itself the stems are weak and prostrate.

A HISTORY OF ENGLISH GARDENING.

(Continued from p. 125.)

GARDEN-FLOWERS OF THE EARLY TUDOR PERIOD.

Indian Pepper.—"This herbe groweth in certain gardenys in England." (Turner, 1548.)
Iris.—Mentioned among the common garden plants by Tusser.

Jasmine.—"It groweth comonly in gardenes about London." (Turner, 1548.)

Kidney Beans.—Plants of this species were commonly grown in the flower gardens of early Tudor times. They were sometimes used for training over the garden arbours:—"Kidney Benes or Arber Benes, because they serve to cover an arber for the tyme of somer." (Turner, 1548.)

Laurel.—Mentioned by Tusser.
Leek.—Tusser recommends that the seeds should be set in spring, and the young plants removed in June. The average price of the seed in Henry VIII.'s reign was 2s. a lb. (Roger's *Agrie. Prices*.)

Lettuce.—"Diverse sortes" were grown: "Cabbage Lettis ... spreading Lettis and grene Endive." (Turner, 1548.) The seed was usually set in March, and the young plants were planted out in May. (Tusser.)

Lily of the Valley.—"Groweth plentifully in Germany, but not in England that ever I could see, saving only in my Lordes gardine at Syon." (Turner, 1548.) Mentioned among the common garden plants by Tusser.

Lote-tree.—"Groweth now in Syon garden." (Turner, 1548.)

Lovage.—"Groweth only in gardenes, so much as I have seen." (Turner.)

Marjoram.—Tusser mentions it among the common garden flowers of his time.

Mollars.—"Common in England." (Turner.) This fruit was very cheap, some 40 being sold in 1515 for 6d. (Roger's *Agrie. Prices*.)

Mint.—Tusser says that seed may be sown at all times. It was used chiefly for culinary purposes: "Take thou this herbe and vinegar, and make sauce, and it will make thee have a talent to thy meat." (*Grotes Herbal*.)

Mellons.—Grown in the royal gardens belonging to Henry VIII. (*P. P. Exp. of Henry VIII*.)

Mulberries.—"Groweth in diverse gardenes in England." (Turner, 1548.)

Narcissus.—"One with a white flower groweth plentifully in my Lordes gardine at Syon." (Turner, 1548.)

Onion.—"This erbe is comon ynough." (Macer.) "Plant from December to March." (Tusser.) The average price during the first half of the sixteenth century was 1d. per bushel. (Brewer, vol. ii., p. 1515.)

Panicum.—"I have not seen it in England, saving in my Lordes garden at Syon." (Turner, 1548.)

Pansies.—Mentioned by Tusser, "Pannes or Heartsease."

Parsley.—"Groweth nowhere that I knowe, but only in gardenes." (Turner, 1548.) Largely grown for culinary purposes: "good in potage and to stop chekyns." (Macer.) The average price of the seed in the early part of the sixteenth century was 2d. a lb. (Roger's *Agrie. Prices*.)

Parsnips.—Directions for planting it are given in Macer's *Herbal*.

Peach.—Commonly grown in Kent and in London in Henry VIII.'s reign. (Brewer, vol. ii., and *P. P. Exp. of Henry VIII*.)

Pears.—Pears were generally grown, and a number of varieties were known (see *Grotes Herbal* under "Cheryes"). The commoner kinds fetched, on an average, 1s. per hundred. (Roger's *Agrie. Prices*.)

Peas.—They be very common and groweth in gardenes." (Macer.) The Runcial variety is mentioned by Tusser as "a daintie."

Periwinkle.—"Groweth plentifully in the gardenes of England." (Turner, 1548.)

Plum.—Macer mentions three varieties, white, black, and red. "They that be black and somewhat hard be the best, they be called damsons, and when they be ripe gather them and slyt them." Macer further mentions that they were pickled. Tusser names several varieties: "grene and grass plums," "damsons, white, and red," "perar plums, white and yellow." Alexander Boordr (1517) recommends that "6 or 7 plums be taken before dinner" to prevent indigestion.

Pomegranates.—"There are certain in my Lordes gardin at Syon, but their fruit cometh never to perfection." (Turner, 1548.)

Pompions.—"Melons is that we call pompions." (*Grete Herbal*) According to Tusser, they were to be planted in May.

Poppy.—"It groweth sowed in gardenes." (Turner, 1548).

Privet.—Mentioned by Tusser. It was chiefly used for planting in hedges:—

"Set Privie or prim,
Set Baie like him."—Tusser.

Quince.—Largely used for making marmalade, and often mentioned in contemporary accounts. In 1518, 220 quinces were sold for 6s. 8d. (Brewer, vol. i., p. 1515.) The fruits were eaten either "roasted or rawe." (*Grete Herbal*)

Radish.—Mentioned by Tusser. He recommends that the seed should be sown in March, and that the young plants should be afterwards removed and planted out.

Raspberry.—They are mentioned by Tusser among his fruits, and also among "herbes to styl." "Respyce wyne" is mentioned by Alexander Boorde (*Devyce*, p. 254). Turner, who calls them "Raspeses or Hynderries," says that they grow in certain gardenes in England.

Rocket.—"Sowe in April." (Tusser.)

Roses.—Tusser recommends that they should be planted in September, and "trimmed and cut" in January. In 1533, trees were sold at 4s. the hundred. (*Hampton Court Accounts*.) The flowers were largely used for making confections, and receipts for making "sugre of Roses," "oyle of Roses," "syrop of Roses," "water of Roses," and "blaysters of Roses" are given in Macer's *Herb* (1524).

Rosemary.—"Groweth plentifully in gardenes in England." (Turner, 1548.) Tusser mentions that the spring was the usual time for planting the bushes. They were very commonly set around the walls of the gardenes of this period. (See *Hampton Court Accounts*, 1533.)

Saffron.—Tusser mentions both the French and English varieties. "The flowers be good for cookes to colour their potage." (Macer.)

Sage.—"Groweth in gardenes." (Macer.)

Savine.—"Groweth in many gardenes in England." (Turner, 1548.)

Service Trees.—Mentioned by Tusser. "Three trees were bought for planting in the Royal garden at Hampton Court in 1535. They cost 7*l.*" (*Chapter House Accounts*.)

Smallaze.—"Groweth in Gardenes." (Macer, also Turner, 1548.)

Snappragon.—Mentioned by Tusser, also by Turner: "I have some in my gardene whose seede come from Italy." "It may, adds Turner, be called Brode cattle snout."

Spinage.—"Spinage or Spinech is an herb lately found and not long in use." Tusser says that it should be sown in March "for the summer."

Stock Gill-flowers—"of all sorts." (Tusser.)

Strawberries.—The favourite fruit of early Tudor times. "Every man knoweth well enough where Strawberries growe." (Turner, 1548.) Tusser writes the following quaint couplet:—

"Wife into thy garden and set me a plot,
With Strawberry roots the best to be got."

Plants were sold at 4*l.* the bushel in 1533 (*Chapter House Accounts*), and the Strawberries at 7*l.* the pottle. (Brewer, vol. i., p. cxlii.) "Strawberry water" was much esteemed. A. Boorde (1542), says, "Water is not wholesome by itself, but better it is to drinke with a wyne or stilled waters," especially water of Strawberries.

Sweet William.—Tusser mentions this plant among his "herbes for a garden," and some plants were bought for the Royal gardens at Hampton Court in 1533. (*Chapter House Accounts*.)

Tarragon.—"Well known in England." (Turner, 1548.) Tusser says: "Set slippes in March."

Thyme.—"Groweth right up in our gardenes." (Turner, 1548.)

Turnip.—Macer gives directions for planting it, and Tusser says that the seed should be sown in March or April.

Wallflowers.—They were called "Wall-gill-flowers." (Tusser.) Tusser writes under September:—

"Set Gill-flowers all that grow on a wall."

Walnuts.—They were sold by women about the streets of London. (Skelton, *Poems*, vol. i., p. 109.)

* The manufacture of fruit and flower "waters" was a favourite occupation of the country housewives in Early Tudor times. Tusser writes:—
"The knowledge of stilling is one pretty feat,
The waters be wholesome, the charges not grete."
Five Hundred Points of Good Husbandry.

In 1532 they fetched 3s. 2*d.* a bushel. (Roger's *Agric. Prices*.)

Winter Cherries.—"Thys herbe groweth much in my Lordes garden at Syon." (Turner, 1548.)

Wormwood.—Groweth nowhere in England, saving only in my Lordes garden at Syon." (Turner, 1551.)

Violets.—Very commonly grown. (See Tusser) In 1533, Violet roots sold for 3*d.* the bushel. (Brewer, vol. i., p. cxlii.) P. E. N.

(To be continued.)

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT MESSRS. J. VEITCH & SONS.

The Cattleya-house at the Royal Exotic Nursery, Chelsea, is now beautified by a display of fine forms of *C. Trianae* in bloom. Hundreds of their gorgeous flowers are arranged along the house, and not a bad one to be seen, while some among them, which are flowering for the first time, are of particular merit: notably, a fine variety as perfect in shape as the famous *C. T. Schroderiana*, but not so large, as it at present appears. Its broad labellum is of that rich velvety crimson seen in *C. T. Osmani*, a fine plant of which stands near by for comparison. The numerous orange-scarlet flowers of *Lælia harpophylla* and *L. cinnabarina* have an elegant appearance among the more massive flowers of the *Cattleyas*, and the well-sheathed exhibition plants of *Lælia purpurata*, for which Messrs. Veitch's collection is noted, forms no inconsiderable feature in the eyes of those who admire the perfection of growth. Perhaps the best examples of good culture are to be observed in the stock of *Aerides*, *Vandas*, *Saccolabium*, *Phalænopsis*, &c., which are generally considered hard to manage, and are anything but creditable in many large establishments. Since the plants at Chelsea have been under the management of Mr. Canham, they—and, indeed, the whole of the Orchids—have made very satisfactory progress.

The Rockery-house always forms a centre of attraction for the best subjects then in flower; and at present its chief display is made by fine specimens of that old favourite, *Dendrobium nobile*, plants of which are arranged about the rocks and suspended overhead. Among them several fine forms appear, such as the nearly white *D. n. pulcherrimum*; the large-flowered and brightly-colored *D. n. rosatum*, and that best of all forms, *D. n. nobiliss.* Some good specimens of *D. Wardianum* and *D. crassinode* are arranged about the house; and suspended, with their elegant flowers drooping around, are *D. Schneiderianum* × *D. Findlayianum*, and others, including a plant in flower of that elegant recent introduction, *D. Macfarlanii*, with its flowers resembling a white *Lælia* anæps, of which Messrs. Veitch have succeeded in procuring a small stock. A central plant on the rockery is a very fine specimen of *Cymbidium Lowianum*, with a very richly coloured lip; and among handsome plants not usually seen are *Paphinia Randii*, *Oncidium auriferum*, *Liparis cylindrostachys*, some rare *Leucostis*, a grand specimen of *Coclogyne cristata Lemoniana*, and *Dendrobium amethystoglossum*, all of which are in flower, together with a fine series of *Dendrobium Ainsworthii* × varieties, of which the last Chelsea introduction, *D. splendissimum grandiflorum* ×, is beyond doubt the best. The *Phalænopsis*, which are kept tolerably cool and drier than is usual at this time, have some examples in bloom. The *Cypripediums* have about twenty-five kinds in flower, some of them in many specimens. This is sufficient to make a good show, but it is perhaps the smallest number to be found in bloom at Chelsea at any period of the year. The fine hybrids, *C. Lathraianum* × *C. Germinyanum* ×, and *C. calypso* ×, are prominent by their noble size and great beauty. Also, in the *Cypripedium-house* is a specimen of *Coclogyne cristata alba* with nineteen spikes of pure white flowers. The cool-houses have a fair show of *Odontoglossums*, *Lycastes*, &c., and many treasures in the smaller-growing Orchids are to be found in the private houses formerly occupied by Mr. Seden

with the hybrid Orchids, but which have now been removed from London, and their quarters handed over to the general stock.

ANSELLIA AFRICANA.

This attractive Orchid, which is a native of Sierra Leone, is now flowering very freely in the collection of the R.-v. W. N. Ripley, Earham Hall, Norwich. One large specimen has six spikes, and the number of flowers on each average from fifty to over 100. It presents a very fine sight, and indicates that Mr. Bartlett, the gardener, knows its requirements thoroughly. The sepals and petals are bright yellow, covered with irregularly-shaped blotches of rich shining brown; the three-lobed lip is also yellow with some reddish streaks on the sides. When this plant is grown well, and produces its spikes of flowers in such abundance as here noted, it forms one of the chief attractions in the Orchid-houses during January and February. J. H.

ORCHIDS AT STONEHOUSE COURT.

There is at present a fine display of bloom in the Orchid-houses of Major Chapman, at Stonehouse Court, Gloucester. *Phalænopsis* are exceedingly well done by Mr. Elmer, the head gardener; they are grown in a small span-roofed house in Teak-wood baskets elevated on pots about 2 feet from the glass, and stand on a bed of coal ashes. They are kept moist, and at a temperature of 65°. *P. Stuartiana nobilis*, a fine variety, bears twenty-two flowers on one spike, *P. amabilis*, *P. Schilleriana*, and *P. grandiflora* are in robust health. *Dendrobium Brymerianum*, with its beautiful golden-yellow fringed flowers, is very handsome; *D. nobile pendulum*, *D. Ainsworthii*, and *D. Wardianum* Lowii, are also in flower. Several large pans of *Coclogyne cristata*, one of the most useful and beautiful Orchids grown, is heavily laden with long racemes of flowers. *Cattleya Trianae*, *C. Percivaliana*, *Cypripedium Lycianum*, *Masdevallia chimera*, and *Oncidium papilio* are also flowering freely. *W. Driver*, *Longford House*, *Mitchinholpton*.

CYPRIPEDIUM ARGUS.

A native of the Philippine Islands, with oblong, lanceolate, acute marbled leaves; median sepal ovate-acute, white, with green and purple stripes of unequal lengths. Petals linear, oblong, ciliate, greenish-white, flushed with purple at the tips, and marked with dark purple warts or blotches. *Reichenbachia*, t. 83.

ODONTOGLOSSUM LUTEO-PURPUREUM VAR. PRINCEPES-PETALUM.

This variety is characterised by its long spike of very large flowers, whose clear yellow ground colour is covered with rich purple-brown blotches, which, on the rose or irregularly serrulated petals, are very numerous and irregular in shape. The plant grows on the mountains of New Grenada, at elevations of from 6000—7000 feet, and does not require, therefore, a high temperature. When the season of growth sets in, in autumn, the temperature should be slightly increased to 61° or 63°, and the supply of water gradually increased. *Reichenbachia*, t. 84.

EPIDENDRUM WALLISII.

This plant, now in flower, is the freest grower of all *Epidendrums*, and flourishes in pans of peat and sphagnum moss. It likes plenty of space for its roots to ramble in, as the roots are almost all found on the surface of the soil. It seems to require no season of rest, and makes new growths while flowering on that previously made. *A. G. C.*

ODONTOGLOSSUM HUMEANUM.

The flowers of this species "may readily be distinguished by their deep cinnamon blotched sepals and creamy-white petals, at the bases of which is usually found a cluster of irregularly-shaped cinnamon blotches. The broadly cordate lip is of a spotless white, occasionally tinged with a suffusion of

pale rose, which presents a striking and agreeable contrast to the bright golden-purple spotted crest." *O. Humeanum* is now supposed to be a natural hybrid between *O. cordatum* and *O. Rossi*. It should be grown in pans near the glass. The plant is in growth nearly all the year, and may be found in flower at nearly all times except during summer. *Reichenbachia*, t. 82.

CATLEYA TRIANE ALBA.

This is of dwarf, compact habit, "with large, bandsome white flowers, and a bright orange-yellow stain round the throat of the labellum." The plants should be grown in pots not too large, in a layer of fibrous peat and sphagnum, spread over the drainage, which should fill the pots to within a couple of inches or so of the rim. Large quantities of water may be given in the growing season without fear of the soil becoming too saturated. At the same time, plenty of air and sufficient sunlight will help the growth to reach a state of maturity, and induce them to develop at the proper season a rich crop of well-formed and beautifully-coloured flowers." *Reichenbachia*, t. 81.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM GENONE, n. sp.

This hybrid, of which a leaf and flower have just been received from R. H. Measures, Esq., The Woodlands, Streatham, was raised by Messrs. F. Sander & Co., St. Albans, between *C. Hookera* and *C. superbiens*, the former being the seed-parent. Mr. Measures states that it is the second which flowered in the St. Albans Nurseries, and that one plant alone was saved from the cross, and which has now passed into the Streatham collection. The leaf is remarkably like that of *C. Hookera*, otherwise it is about as intermediate between the two parents as could well be. The dorsal sepal is ovate, acute, light green in the centre and the base; suffused with pale purple on either side, and nearly white on the margin; the nerves of a green colour, and about twenty-three in number. The petals are oblanceolate-oblong, of a light green colour below, passing into rosy-purple in the distal third, densely spotted with purple-brown, except at the extreme apex; the margin ciliate and a little crenulate. The lip is much like that of *C. superbiens*, and is brownish-purple in front, paler and greener behind; the side lobes with numerous small purple-brown warts; the staminode much like *superbiens* in shape, but a little more deeply notched in the front, the centre whitish-green with some dark green markings on each side, passing into a pale purplish tint towards the margin. The character of *C. superbiens* somewhat preponderates in the flower, especially in shape, but the influence of *C. Hookera* is also markedly apparent. *R. A. Rolfe*.

SPECIES OF ERIOGONUM.

Among the North American *Eriogonum* there are many very fine species, well worth cultivating in European gardens, where at present only a few varieties are known. The plants are annuals or perennials, some also are little shrubs a few inches high. The leaves of many species are cover with a silvery white down. The flowers are white, brilliant sulphur-yellow, or purple; small, but arranged in clusters, within a cup-shaped involucre, sometimes twenty, thirty, or even more of them together. The inflorescence is most varied in size or shape, you find some heads the size of a hazel-nut, and some as large as a Peach; the large umbels are 6 inches or more in diameter, and the inflorescences resemble those of *Statice* and *Gypsophila*, but on the other hand some are long, white, twigg forms, set with clusters of flowers along the whole length of the stalks, which are well adapted for arranging as cut flowers. I should like to draw the attention of gardeners to this lovely group. The cultivation is difficult, as most of the plants are found on

dry sandy hills. Some grow at higher elevations, and by their dwarf habit are well adapted for rockeries. They grow in western North America, and as far down as California and Mexico; some also are found in Chili. The following varieties are most adapted for gardens:—

FIG. 38.—ERIOGONUM ANDROSACEUM: FLOWERS YELLOW.

Eriogonum androsaceum.—A dwarf, much branched perennial, with lanceolate, white, downy leaves, about an inch long. Scape, 2 or 3 inches long. Flowers, yellow. Habitat, Rocky Mountains and British America.

E. Jamesii.—Perennial, similar to the former, but

FIG. 39.—E. OVALIFOLIUM: FLOWERS ROSE-COLOURED.

leaves with long petioles, broader, ovate, lanceolate, and with sessile involucre. Found on high ledges or rocky hills near Chihuahua, Mexico.

E. caespitosum.—A very nice dwarf perennial, of close habit, suitable for rockeries. Leaves ovate to oblong-spatulate, two to six lines long, tomentose

on both sides. Flowers yellow; fruit, when ripe, red. One involucre, with numerous flowers on a bare stalk. Found in North-west Nevada to Wyoming territory, as high as 8000 feet.

E. Douglasii.—Perennial, very similar to the last species, but centre scape bearing a whorl of bracts. Habitat, North California, Oregon.

E. ovalifolium (fig. 39).—This charming perennial species it especially well adapted for rockeries. Leaves greyish-white to silver-white, tomentose on both sides. Flowers numerous, rose-coloured, white or yellow in a close head on a bare scape. Habitat, North California to Colorado and British America.

E. sphaerocephalum.—This species is similar to *E. Douglasii*, from which it differs by the long, linear, spatulate leaves, and the more branched shoots. Whilst *E. Douglasii* resembles *E. ovalifolium* in habit, *E. sphaerocephalum* is a much spreading, creeping shrub. The shoots are about 2 inches long, and bear at the ends a single head, with numerous yellow flowers on a 2 inch long bracteate scape. *E. sphaerocephalum* is found in North California, and from Nevada to Washington Territory.

E. flavum.—A species allied to *E. androsaceum*, but the involucre bear more flowers, so that the whole inflorescence forms a large head. Flowers yellow, silky in texture externally. Washington Territory to the Saskatchewan, and South to Colorado.

E. villosum.—Perennial, densely tufted, and very shaggy throughout the crowded oblanceolate leaves, half an inch long, peduncles only an inch high, involucre few, in loose heads, bracteate at the base. Flowers silky within and without. South Utah.

E. umbellatum.—A highly decorative stoloniferous perennial plant, from 6 to 12 inches high. The long-stalked involucre form a simple umbel of from three to ten rays. Leaves long, toothed, ovate, lanceolate, somewhat downy. Flowers yellow. In habit similar to *E. compositum*. N. California and Oregon to Colorado.

E. usinum.—Perennial. Scape long, averaging 1 foot in height, umbel compound, but stalks of the involucre very short, so that the whole inflorescence forms a club-shaped head. Flowers whitish, leaves ovate, tomentose on the under-surface. California.

E. Lobbii.—Perennial. Scape about 1 foot high. Rays of the umbel few, usually very short and undivided. Flowers large, and very numerous in the involucre. Leaves oval or rounded; petioles about 4 inches long, tomentose on under-surface. From the Sierra Nevada.

E. compositum (fig. 40).—A large (perennial) plant, a foot or more in height. Umbels compound, rays elongated. Leaves oblong, ovate, cordate, white and downy on under-surface. A distinctive species, suitable for rockeries and borders. Washington Territory and Idaho to North California.

E. horaeoides.—Similar in habit to the former, but the leaves almost linear, lanceolate, the scape bracteate, and the peduncles of the involucre irregular. The flower-heads are small. Washington territory to Utah. *U. D.*

(To be continued.)

A GARDENERS' PROBLEM.

As a gardener who is fond of travel, and fancies he has learnt much therefrom, I cannot help entering a protest against some of Mr. Ewbank's remarks on the little value of information as to the natural habitat and growth of plants. What I venture to think Mr. Ewbank does mean is that such knowledge is generally insufficient, and what I think is least of all considered is, "What are the conditions of my garden?" The more perfectly we can imitate the conditions under which a delicate plant grows and thrives naturally, the more certain we must be of success. But the strength of a chain is no greater than that of the weakest link, and if we fail in one link we most probably fail in all. So then, what is needful is to consider not only the conditions of a plant at home, but its condition in your garden when

you have planted it there. For instance, Mr. Ewbank speaks of the futility of imitating the conditions under which alpine *Primulas* thrive at home, and says, "Death and destruction would have waited on them in my arid garden." Here we have the whole thing in a nutshell. Mr. Ewbank's garden is much hotter and drier in summer than the Alps; hence, with him these *Primulas* will thrive in wetter positions and more retentive soils than they would do at home. In the north and west of England they thrive under the very conditions of soil and situation that would kill them in Mr. Ewbank's dry and hot garden.

Clianthus Dampieri has no doubt been considered a very tiresome, as well as gorgeous plant, but then has any traveller who is also a gardener failed to remark that in its native country its collar is *not* wetted by daily or frequent waterings with cold and probably lime-laden water? The fact being, that in its home the dry season has set in before it flowers, and not a drop of rain does it get in a general way till long after every fat pod is full of seeds ready for another year. Thus a thoughtful Quedlinburg nurseryman by raising it on stilts, has done for it by art, what Nature provides at home.

Mutisia decurrens is another instance of a difficult plant to grow; but I differ from Mr. Ewbank in his remarks on it, for I foolishly, no doubt, feel very confident that had I seen it growing in its native country I should have a far greater chance of growing it well; indeed, as it is, or rather was, I lost it through the marauding slug that ruthlessly ate off the shoots one spring, when I was absent from home, as is so often my misfortune.

Last May, on the Italian side of the Alps, I was enraptured with the magnificence of the crimson *Polygala Chamæbuxus*, growing in sheets under the Chestnut trees; perhaps Mr. Ewbank will be surprised to hear that the soil it so luxuriated in was pure leaf-mould, decayed Chestnut leaves, in which *Erica carnea* and *Urticas* seemed to revel equally.

In the north of Scotland, I have seen *Tropæolum speciosum* revelling on a south wall, while in hotter England it needs a cool aspect, we all know. Is not this merely want of knowledge as to the temperature and moisture it enjoys in Chili, when we say it requires one or the other? what it evidently likes is a mild and uniform climate, such as Chili is supposed to possess.

I am not sure that any one who has seen the swarms of mosquitos in Canadian swamps will be surprised to hear that *Cypripedium* spectabile enjoys liquid manure. Surely such a number of dead flies must count for something in the way of manure?

No: the thing we want is perfect knowledge; then we shall not attempt under circumstances where we must court failure; but more than half the battle is, "knowledge of the climate, soil, and temperature of your own garden." *E. H. Woodall.*

— I find it hard to accept the doctrine that plants in a state of Nature are not found in positions that are best for them, but where they can exist. In the immense periods of time in which plant distribution has taken place, plants in my humble opinion have found the soils and places most congenial to them, and their continued existence is a proof of it; where the conditions have proved unfavourable, they have died out. That some plants will grow under varied conditions of soil I am prepared to admit, but that fact should not prevent us from following indications derived from observation of the natural circumstances that are found about a plant, and which have conducted to its healthy development. A collector failing to observe that *Ericaceæ* and kindred plants grow on peaty soils, and attempting to cultivate them on clay or limestone, would soon be convinced of his error (see page 265); here the plants have chosen congenial positions, as our barren moorlands testify, and even Gorse and Broom are happier on peaty wastes than on richer soils. *Hippophae rhamnoides* grows and develops its best characteristics

on the deep sand banks found on the Lincolnshire coast; *Psamma arenaria* and *Elymus arenarius* thrive in similar positions, but are never found on the rich lands within the banks. That *Hippophae* delights in sand, and adopts it where the selection is possible, I have other evidence besides that of Lincolnshire. I have seen it flourishing on the sandy banks of the Isère in Savoy, and I have found *Elymus* on the sandy accumulations on the banks of the upper part of the Rauma River in Norway.

Mertensia maritima has been mentioned as showing an aversion to salt. I know one of the favoured habitats of this plant, it is growing freely in a little indentation on the N. E. coast, washed by high tides, and frequently sprinkled with spray. The soil in which it grows is saturated with sea water, so I cannot accept the opinion that salt is inimical to its nature. Some of your correspondents are writing from the partial experiences of the light loams and

PLANT NOTES.

RHODODENDRON ARBOREUM VAR. ROSEUM.

A plant of the above, from 2 to 3 feet high, has for several weeks been in full bloom at Kew, and is bearing twenty beautiful trusses of bloom, each measuring 6 inches across. The flowers are campanulate, 1½ inch across, and of a rich soft rose. In the typical arboreum the flowers are bright red, and the leaves are silvery underneath, it is therefore readily distinguished from this variety, which has the under surface of the leaves covered with reddish-brown down. It is unusual for plants of the size mentioned above to flower freely, but this may probably be due to its being grafted, and the scion obtained from a flowering plant.

A nearly allied form of arboreum—*R. nilagiricum*—is just beginning to flower, and which, in beauty, is not inferior to *R. a. roseum*, but it is some six or eight weeks later. The flowers are of a rich deep rose at first, and become paler with age. The flowers are much spotted with crimson, and this feature and the later flowering of the plant are the only noticeable distinctions between the two.

AGAPETES MEXICOLA.

Considering the beauty and easy culture of several of the greenhouse species of *Vaccinium* and *Agapetes*, it is strange they are not more frequently grown. At Kew about a dozen of them are cultivated in the Temperate-house, and the most ornamental is the one above named, which is now in flower. It is a graceful shrub, with slender branches clothed with small leaves of a dark green colour; the flowers tubular, an inch in length, and of a bright red, and produced in abundance on the ripened portions of the shoots. It is stated to be an epiphyte in its natural habitat, and to possess a tuberous swelling at the base of the stem. Perhaps the plants at Kew are as yet too young, as they give no indications of the latter peculiarity. They are planted out in beds of peat, and grown also as pot plants, and thrive under both conditions. *W. B.*

FIG. 41.—RHODODENDRON ARBOREUM, p. 261.

VEGETABLES.

BRUSSELS SPROUTS.

THE value of Brussels Sprouts can hardly be overrated, and it is not too much to say of them that they are the most useful vegetable grown, as not only are they delicious in flavour when cooked, but their season is a very long one, and being so exceedingly hardy, plants may always be relied on to stand the winter, and yield a supply for many weeks in succession. To have them in the autumn, and with big stout stems that will throw fine sprouts, it is necessary to sow early, and especially in northern counties and cold districts, where the first batch should be raised under glass, the plants pricked out and favoured with the same protection, so as to get them as strong as possible, and ready for planting out in the open as soon as warm weather sets in. In cases where only a few hundred are required, the best way is to sow in boxes and place them in gentle heat; but where a great number is wanted, it is advisable to make up a small hotbed, and place a frame on it, which should then be partly filled with leaves, and have a few inches of light soil put in and made firm and smooth, when the seed may be sown thinly, and only just covered with mould; and if the frame is kept close for a few days the plants will appear, when the frame must be ventilated regularly to prevent the young plants getting drawn and weak. Equally important as early sowing, are good depth of soil well manured and ample space from plant to plant. It is a good way to plant Brussels Sprouts at least 4 feet apart between the rows, and have Potatoes between them, as by doing this both crops are benefited by the large amount of space afforded,

river drifts of the Thames valley, and from the Bagshot sand formation, which soils, like that at Kew, lightly enriched by humus, and having no marked or powerful mineral characteristics, provide the conditions required by many plants, but it is not a question of merely keeping a plant in existence, but of finding a soil that will encourage it to produce its best and most desirable qualities, both of flower and fruit. The distribution of some plants is in certain cases more a question of rainfall than soil; if a certain depth of decomposed vegetable matter exists on the surface, no matter on what soil it rests, and the condition of climate that prevails securing it adequate supplies of moisture, it will grow. The places in which I have found *Gentiana verna* to thrive are Teesdale, and the wet meadows between the lakes of Thun and Interlachen. It is not climate alone that gives Jersey its pre-eminence in a horticultural point of view, but its wonderfully fertile granitic soil. *William Ingram, Belvoir.*

Although there are now many strains that are of much larger size than the old imported Sprouts, there are none in my opinion equal to a good select strain of the latter, which produces very close hard Sprouts, of mild flavour.

LEEKS.

To have these really fine they require a long season of growth, and to be raised early. The best way to sow Leeks is in boxes, or on a gentle hot-bed, so as to get the plants earlier than it could be done in the open air, and as soon as large enough to handle, they should be pricked out—still under glass, or potted singly, and nursed on till May, and then planted in prepared ground or in trenches. Although the latter method gives the most trouble, the plants will grow larger and with longer stems, as it is very easy, when they are in trenches, to water them, earthing up to blanch being done in the autumn. A suitable depth for a trench is 6 inches, and they should be prepared like Celery trenches. The Leeks may be put out in these trenches at 1 foot apart, and well watered to give them a start. Very good Leeks are grown by planting them in holes, and leaving just the tops of the plants standing out, but the ground for them must be deeply dug and of a light friable nature. The main point is to have fine strong plants with plenty of root, and a large dibble should be used to make the holes, which may be 1 foot apart, and into them the plants should be dropped, and a very little soil knocked in to steady them. The necessary hoeing of the land gradually fills up the holes, and Leeks elongate and become very large. *J. S.*

COLONIAL NOTES.

SOUTH AUSTRALIA.

A CENTRAL Bureau of Agriculture has been established with the following objects:—

The Bureau will collect and publish by means of the Press, and with the aid of the district bureaus, information of every kind calculated to prove beneficial to the colonists engaged in agricultural, horticultural, pastoral, and other pursuits connected with the cultivation of the soil, such as—

1. The suitability of the various districts of the colony (in regard to soil, situation, elevation, aspect, &c.) for the growth or production of plants, animals, &c.
2. Information obtained respecting plants, animals, products, &c., likely to prove of value to cultivators.
3. The best methods of cultivating various kinds of crops, and of breeding and feeding domestic animals, and of improving the same.
4. The methods of preparing and preserving various products for market, and discovery of markets for the products of the soil.
5. The collection of agricultural statistics, particularly as affecting the area under cultivation in each district; the number and breeds of animals; the nature and condition of crops during each month; the times of sowing or planting and harvesting; the average yield per acre of fruits, cereals, &c.; the cost of cultivating each kind of crop; and all information that might serve to guide intending settlers.
6. The collection of information respecting all kinds of pests affecting the farm, forest, garden, orchard, and vineyard.
7. To ascertain and suggest the best means of eradicating poisonous plants, and of combating the effects of disease or the ailments of domestic animals.
8. To prevent as far as possible the introduction and spread of such pests, and to induce colonists to give the earliest information concerning the appearance of previously unknown plants, or parasites upon plants, or of diseases of animals, in order that the same may be at once identified and dealt with.
9. To publish, when necessary, bulletins, abstracts, and reports containing all such information as may be deemed desirable.
10. The district bureaus to be asked to give every assistance in their power in aid of the objects of the Agricultural Bureau.

THE APIARY.

BEE-HOUSES.

BEE-HOUSES are exercising a good many minds at the present time. Since the advent of the bar-framed hive they have been more or less run down—partly, no doubt, because of the completeness of modern hives; but they seem to be coming into favour again, and much may be said in their behalf. I know several people who have very handy lofts, and in all cases these bees turn out well. They winter well, are ready for swarming sooner than the bees kept out-of-doors, are ready for supering before any others, and yield a larger surplus. Lots are, of course, of the nature of bee-houses. But now "house apiaries," as they are called, are being regularly built and used again.

When one is being constructed, it is better to build them too large than too small. Room ought to be left so that the manipulator can not only move about, but space should be left to keep articles for use, and even to extract. It is very convenient for a bee-keeper to have all his tools together. If care be taken with the extracting, no inconvenience ought to be experienced from robber bees. The best shape is a fairly long house, with one of the long sides facing the south.

All along the south side hives can be arranged. This would leave the opposite side and two ends free. There will, of course, be a door, and this ought to contain a revolving window. When manipulating, some bees are sure to escape, and would find their way at once to the window. This could be revolved, and all the bees would at once be outside, and would go to their hives. Though there would be an expense in setting up the house at first, much would afterwards be saved by possessing strong colonies of bees, and in the matter of covers, &c. Some people arrange their hives on shelves, and make the shelves act as floor-boards, thus saving floor-boards and covers as well. In this case the hives may consist simply of four pieces of wood nailed together. The matter is well worth consideration where a little outlay at the first is not a great obstacle. Very good houses can be obtained from most dealers in bee appliances, and at a cheaper rate even than they could be put up by the local carpenter. *Dec.*

THE BULB GARDEN.

THE CULTURE OF LILIES.

I ADVISE amateurs who wish to grow *Lilium auratum* and other Lilies at the side of shrubberies or near trees, to sink below the level of the soil, casks with the bottoms out, to fill them with good Lily soil, and to plant the bulbs about 6 inches deep. In the *Gardeners' Chronicle* of September 23, 1889, p. 362, I mentioned having tried a paraffin cask. At the side of this were two Lily beds, from which the soil had been taken out about 5 feet deep, and Lily soil filled in. On lately examining these beds we found them, though the Lilies had only been planted nine months, filled with roots from the shrubs, sufficient to impoverish and dry the soil. I have now sunk a number more casks, principally old linseed-oil casks, which are of greater diameter than paraffin casks, and will report results. I think gardeners are sometimes blamed for Lilies failing, when it is the tree roots that are in fault. One of the oldest and highest of the hardy plant authorities, on seeing the cask plan, paid it the compliment of adopting it. *George F. Wilson.*

PLAGIOLIRION HORSMANNI.

Since its introduction to cultivation from Colombia, in 1883, by Messrs. F. Horsman & Co., of Colchester, this remarkable *Amryllid* seems to have been greatly neglected in gardens. Why this should be so it is difficult to imagine, for it is

certainly a very pretty plant, with its strong scapes of pure white flowers, which are produced in great abundance. It is interesting as forming the type of a new genus, established and described by Mr. J. G. Baker in the *Gardeners' Chronicle*, July 14, 1883, p. 38. A figure of it also appears in the same month and year at p. 105, which, although not representing the vigour and size of the plant now, nevertheless shows the shape and peculiarity of the flowers very correctly.

Plagiolirion Horsmanni has been in flower in Messrs. Sander & Co.'s nursery, St. Albans, since the middle of December last, and still seems to be quite vigorous and fresh. It is planted out in a border, growing in rich loam, with a little peat and leaf-mould mixed, and no special attention is given to it. Still it thrives. The bulbs are ovoid, and bear at the summit two or three broadly oblanceolate leaves, which measure about 2 feet long, slightly channelled in the centre on the upper surface, and having a prominent fleshy midrib beneath. The stout glaucous-green scape attains a height of over 2 feet, surmounted by a umbel of about thirty to forty pure white flowers, which expand centripetally. Their chief peculiarity is in having the segments in a semicircle, and radiating upwards, like the ribs of a fan; while the stamens, which are about half the length, radiate downwards. It is owing to these oblique, or one-sided characteristics of the flower, that the genus received the name of *Plagiolirion*. *John Weathers.*

CROCUS BALANSÆ.

This charming little species, now in flower in many collections, is a bright gem even amongst spring Croci. It was first introduced and described by G. Maw, Esq., who received the corms from M. Balansa. In general appearance it is nearest to *C. Sisianus*; the flowers, however, are smaller than those, and of a bright rich orange colour inside; the outer surface is coated purple-brown, and when seen in large masses, the flowers being half open, it makes a very striking picture. *C. Sabini* variety *versicolor* has a ground colour of lilac, and the tips of the segments marked dark purple, is also a striking Crocus, and one that should be grown largely for spring flowering. *C. aërius*, *Bililotii*, and a few of this class, should also be included in all collections, on account of their free flowering, as well as hardy constitutions. *J.*

PLANTS AND THEIR CULTURE.

THE CONSERVATORY AND ITS SUPPLY PITS.—

The conservatory at this date should be bright with Acacias in variety, and Camellias and forced plants, including bulbs. Primulas and Cinerarias will now be in good bloom, and these, and forced Indian Azaleas and other plants, will soon require to be shaded during the middle of the day, for which purpose the blinds should be got in readiness, and repairs to these done without delay. Azaleas soon lose their freshness, if exposed to the full glare of the sun. Any Camellia plant which has grown naked at the base may, as soon as the bloom is over, be shortened back, and allowed to break into new growth, giving it a light position, so that the growths may not be weak. Creepers should be regulated and thoroughly cleaned.

Cuttings of various species of climbing plants may be propagated at this season, taking them off with a heel wherever possible. Many of these plants are attacked by white scale, and the present is a favourable time to rid them of these insects. Any old plants of *Aspidistra lurida* which are in sour soil should be turned out, broken up and rotted, and the plants given a mild bottom-heat. *Aspidistras*, when large, require manure-water to keep the leaves in health, and with this intent soot-water once or twice a month is beneficial. Some corms of *Gladiolus gandavensis* should be potted up for early summer flowering. *G. Brenehleyensis* is also an effective plant; a cold frame will suit these. A sowing of *Nicotiana affinis* should be made now, and again at intervals of two months until July.

Mignonette may be sown in small pots, employing

a good compost. *Mimulus*, in variety, if not sown in the autumn, should be sown at once, and as soon as the seeds appear removed to a cold frame, and placed close to the light. A pan or two of *Schizanthus* in variety, if not sown earlier, will come in useful for the conservatory during the summer, if sown at once. *Celosias* should be sown in heat for summer decoration. This sowing need not be a large one, as another should be made in six weeks' time. It is best to grow these plants quickly, and to give them no check. A few dwarf *Scabiosa* are effective in pots when grown early. A sowing of *Browallia elata* and *B. alba* should be made, these being charming decorative plants in the cool greenhouse or conservatory. *Rhodanthes* of sorts should be sown in gentle heat, transferring them to the frames when ready. *Amaranthus* of sorts need for a time treatment similar to the *Celosias*. *Aceroliniums* of sorts are useful conservatory decorative plants, and are as pretty for this work as the *Rhodanthes*.

Herbaceous Calceolarias should get a shift again, if it be necessary, and they must be kept perfectly clean, using a large quantity of loam at this shift. *Liliums* should get full exposure to light, as the bulbs should be growing freely at this date, being kept quite close to the glass. Any potting of bulbs should be completed as early as possible. *Ixias*, *Sparaxis*, and *Babianas* should get all the light possible to prevent drawing, and be kept in a cool place; cold pits are the most suitable for them if they are kept just free from frost.

East Lothian Stocks will be growing freely, and should be assisted with weak liquid manure. Succession plants of these Stocks should be shifted, if required; also the useful *Primula obconica*, for summer flowering, should be shifted into larger pots. *Auriculas* should be kept free from decayed leaves, and any top dressing done that may be necessary. An early sowing of the useful *Campanula pyramidalis* should be made, and when the seedlings are large enough they should get a cool place in which to grow. *Geo. Wiggins, Spina House.*

THE ORCHID HOUSES.

EAST INDIAN HOUSE.—*Thunia* (Phaena) *Marshalliana* and *T. Balaonice* will now be breaking away with young growths, from the base of the pseudobulbs last made. They should now be repotted, and in doing this, I use a compost consisting of about three parts of good fibry peat, one of sphagnum moss, and a good supply of silver sand. The pots should be prepared in advance, *i.e.*, they should be filled three parts with potsherds, with a sprinkling of sphagnum over them, the whole should then be firmly packed, and sticks inserted to hold the plant firmly. Where there are several plants of the same variety, it is a good practice to take all the strongest growths out of a pot, but leaving the weaker growths to make another year's growth by themselves; and by doing this every plant in the pot will flourish.

Sphecochloris Kimballiana is a beautiful Orchid now in flower, and was potted in a compost consisting of one half turfy loam, one part fibry peat chopped short, and one of sphagnum moss, with a little silver sand added. It is an exceedingly free flowering species, and makes abundance of growths.

Dendrobium Lowii, now finishing up its growths, must not be kept quite so very wet, still it must not be allowed to be very dry for a long time together, it being a great lover of moisture at the roots. The same remarks will apply to *D. McCutchie*, at this time of the year.

Cyclopogon Massangana, now starting into growth, may be re-basked if this be found necessary. I find that these plants are much more effective when they are of small size, say with three or four blooming growths; they may be then hung about to advantage. They do well in peat and sphagnum moss.

Temperatures for this house 65° at night, with a rise of 5° to 10° by day.

Cattleya House.—General attention may now be directed to this house, and, if it contain *C. Harrisoni* and *C. Lobbii* these will now require repotting. *Laelia lilacina* now in flower is a very beautiful plant. Any plants of *Vanda teres* or *V. Hookeriana*, which have been resting in this house, should now be put back into the position they will occupy when growing. I grow them at the south end of a stove, close to the glass, where they are never shaded, but syringed three and four times a day. I am inclined to believe that *V. Hookeriana* is better when allowed to remain the

year throughout in the stove. I have been experimenting with it, and will report progress at a later date. *A. G. Cott, Parkfield, Worcester.*

THE HARDY FRUIT GARDEN.

PROTECTION FOR FRUIT TREES.—The pruning and training of all fruits, Peaches and Figs excepted, having been brought to a close, the most pressing matter is the due protection of the blossoms from injury by frost. The difficulties attendant on protecting fruit trees in the open ground are too great for it to be attempted except in the case of low-growing espalier and cordons. On walls, whatever is applied should be done at the right time, that is just before the flowers begin to expand; and the application of protecting materials is a question which each person must decide for himself. Whatever be used to screen trees from frost, it should be open enough to admit air and some amount of light, for to put on materials which are heavy and thick not unfrequently does more harm than good, as keeping the flower buds close and in semi-darkness renders them too weak to set well. A cheap and generally efficient protection will be found in tanned herring netting in two or three thicknesses; and where no good permanent wood or glass coping are put up, some 3-inch boards cut into long lengths and fixed close up to the brick coping of the wall will be found to keep off rain and sleet, and intercept radiation of heat from the wall. These board copings are of great service in keeping the blossoms dry—an important point in obtaining a good set. Light Fir poles, Bamboo-poles, or the like, fixed in the ground at a distance of 6 feet apart, and 3 feet from the bottom of the wall, and sloping upwards to the board coping, and secured with a nail, will serve to keep the netting or other material from the walls, and give space for any one to pass underneath. Some lines of strong twine should run from pole to pole, and made fast to each, thus adding to the security and efficiency of the protection. Some years ago, I used to employ blinds of strong canvas, which were worked on iron rods at the top of the wall, and when in use were hooked to boards placed at a short distance from the wall, but when the south-west wind blew strongly it tore nearly everything away. *A. Evans, 1, 1/2 Hill, Haslemere.*

FRUITS UNDER GLASS.

THE PINERY.—The details given in former *Calendars* may not be relaxed, especially with those plants dependent upon their bottom-heat from deep beds of tan or leaves, for oftentimes the fermentation increases during a fortnight after the new material is put in, and great injury inevitably follows if this be not noticed and remedied.

Fruiting-house.—Those fruiters which have shown fruit since October, may now be forced harder, and as the days lengthen, the moisture may also be increased. Carefully note the state of the soil, as greater activity of the roots will demand more water being afforded. When watering has become necessary, weak guano-water at a temperature of 90° may occasionally take the place of pure water, and remembering that dribble-watering is to be avoided. Examine frequently the centres of probable fruiters, and as soon as the bloom-spire is observed, the plants should receive liquid-manure water, being careful at the same time not to wet these plants overhead when syringing the house, until the period of flowering is passed. All walls, paths, and surfaces of beds should be thoroughly damped at closing time, and oftener, when the atmosphere is dry and arid. Maximum night temperature, 70°; of the day, 80° to 90°. Bottom-heat maximum, 90°.

Succession-houses may be kept less close, by more ventilation being afforded, but avoiding cold draughts and checks of any kind. The bottom-heat may stand at 70° to 75°; the day warmth may not exceed 65°. Suckers that have been kept close till rooted may be gradually inured to less humidity. The maximum night temperature, 60°; maximum day temperature, 80°, with sunshine; and do not omit to moisten all dry surfaces at closing time.

Vines.—In houses where the Grapes have been thinned, the Vines will be benefited by a sprinkling of manure, Thomson's or other, which may be

washed in with water at 80°, that is, when the borders are inside the houses, some spent Mushroom bed dung being spread over them afterwards. If strong farmyard dung be used as a mulch, the ammonia arising therefrom must be allowed to escape through the top ventilators in the early morning, or the first strong sunshine will cause the tender foliage to "scald." Keep a look-out for the appearance of red-spider, especially in hot dry corners over the pipes, and on the appearance of yellow-speckled foliage, at once sponge it with soapy water. The foliage of the Vines may have an occasional syringing of clear soft-water at closing time. To make this, a one peck bag of soot should be stood in 24 gallons of water for twelve hours, and the water made in this way will be found quite safe to use with the syringes. The floors, walls, and those portions of borders dried up by the pipes, should be occasionally damped down with liquid manure at closing time, and alternately with soft water. Afford a chink of night air by the front ventilators if it is passed over the warm pipes. "Hit or miss" ventilators are the best, but perforated zinc and hinged wooden shutters are nearly equal to them; the zinc ventilator prevents the ingress of mice, &c., and serves to break up cold currents of air. Maintain a night temperature of 60°, and if the thermometer falls still lower on cold nights, the rest obtained in that way during the hours of darkness will not be without benefit to the Vines. The day temperature should be about 80°, more or less, according to the state of the weather.

Fruiting Pot Vines.—Continue to give liberal supplies of liquid manure, and top-dressings of turfy loam to cover the roots as they appear on the surface. Maintain a high humid temperature by day, so long as the berries are swelling, giving partial rest at night. The stoning period is at hand, when little apparent progress will be made, but do not neglect previously mentioned details. *W. Cramp, Malvern, Court, Malvern.*

THE KITCHEN GARDEN.

SEKALE FOR FORCING AND PLANTING.—In getting up a stock of this vegetable, cuttings of the roots, 6 inches in length, will be found to be more certain in results than seed, and plants will make good crowns from these by the month of October, good enough for forcing or planting. The ground should be well tilled and manured. The sets may be put out at 1 foot apart in the rows, and 18 inches between the rows. The top of the set may be an inch or so beneath the surface, and the hole filled up with coal-ash or fine soil. Before planting, tread the ground, if light, to a moderate degree of firmness, and give it a light rake over. There is no necessity of planting pieces with a crown bud, and pieces without a bud seldom flower the first season. If plantations are to be made for forcing under pots, dibble in six or eight sets in clumps, according to the size of pots, 3 feet apart. *Seakale*, although it delights in a moderately firm soil, requires good drainage, and free exposure to the sun, to assist the maturing of the foliage.

Potatoes.—In mild weather, a few of *Meant's* or some other early variety may be set on a sheltered border, and some may be put at the base of a south wall and between the rows of early Peas. Plant the sets rather deeper and closer together than is usual for later plantings.

Cauliflowers in Frames.—If hand-lights in good numbers are available, some of the plants wintered in frames may be planted out, taking the plants where standing thickly together. Outside planting should be deferred to the last weeks in March. Good soil, deeply trenched and manured, is best for *Cauliflowers*; and for hand-lights four plants should be used to each, affording full ventilation during the day, and when it is bright weather removing the tops till evening.

Parsnips may now be sown on well-trenched ground free of rank manure, allowing a distance of 14 inches between the rows. Sow the seed rather sparingly in drills an inch deep, or the seed may be dropped in three or eight inches apart, to save labour of thinning later on. Lift and store the remainder of the last year's crop in a cool place, trimming off the crown soon what closely.

General Directions.—If frosty weather should set in, get manure wheeled to quarters where it is required; trench and dig all vacant plots. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	MAR. 3	Lilies, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
TUESDAY,	MAR. 4	Roses, and other Plants, at the City Auction Rooms, by Protheroe & Morris.
WEDNESDAY,	MAR. 5	Roses, Fruit Trees, Border Plants, Shrubs, Conifers, Lilliums, Dahlias, &c., at Stevens' Rooms. Lilies, Palm Seeds, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
THURSDAY,	MAR. 6	Imported and Established Orchids, 10,000 Libum auratum and other Lilies from Japan, at Stevens' Rooms. Nursery Stock from Sample, at Protheroe & Morris' Rooms.
FRIDAY,	MAR. 7	Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°.

It is quite natural that those who are familiar with the difficulties and entanglements experienced by the Royal Horticultural Society at South Kensington—difficulties from which the Society has even now barely emerged—should feel some alarm at the proposal to incur a large outlay in bricks and mortar. The proceedings at the annual meeting were not fully reported, nor was any definite programme in black and white laid before the meeting. This was unfortunate, for had a bare outline of the scheme been committed to print, with an accompanying estimate of the cost and of the means of obtaining the requisite funds, been circulated beforehand, much misapprehension would have been avoided. Fellows, both old and new, who were not at the meeting, and some who were, have written to us expressing in no measured terms what they consider the wanton folly of the proposal. Such opinions are, however, based upon an entire misconception. The Society, as a society, is in no way committed to do anything more than pay the rent for the premises it is proposed it should occupy in lieu of those now made use of.

To prevent, so far as possible, the further spread of misunderstanding, we applied to Baron SCHROEDER for a brief statement of his views, which he has been kind enough to give us in the following terms:—

"In reply to your letter of yesterday's date, I beg to state that the gentleman, whose letter you inclose, and which I now return, entirely misunderstands my proposal for the building of a horticultural hall. The money which I propose to collect will not go into the hands of the Royal Horticultural Society, but is to be invested in the names of three trustees, who will be responsible to the lenders for the proper

investment of the funds; they will have to invest the greater part of it in first-class securities, bearing interest; the minor part they will have to invest in building a hall of horticulture and offices attached to it.

"The Horticultural Society will have to pay interest in lieu of rent for the building they occupy, and the total interest derived from the investment and payment from the Royal Horticultural Society in lieu of rent will go to the payment of the ground rent by the trustees. I calculate that the total thus received will cover the ground rent, and the trustees will ask no payment from those that give the money until £30,000 to £40,000 have been promised, to secure the due payment of the ground rent.

"You will thus see that the Royal Horticultural Society will not be made responsible for more than the rent due for the building they occupy. J. H. W. Schroder."

Since this note was written, we have received from the Royal Horticultural Society a circular which it is proposed to send to all the Fellows, and which, as showing exactly what is intended, we here append:—

"When, at the end of the year 1887, our Society was compelled to vacate the premises at South Kensington, and, failing better accommodation, the Council made an arrangement with the officers of the London Scottish Volunteers for the use of their Drill Hall for the Society's fortnightly meetings, this step was regarded as being of a distinctly temporary nature, and desirable only as affording the Society time to recover itself before making provision for a permanent home.

"During 1888 and 1889, the Society has devoted itself energetically to its true and legitimate work, viz., the improvement, both in quantity and quality of the food and floral productions of our country, and the circulation of such information and knowledge, gained by experience and trial, as may tend to the practical advancement of gardening, orcharding, and such like. The policy pursued by the Council has met with such general and widespread approval, that a very large number of new Fellows have joined the Society, and the Council feel that the time has now come to take the first step towards bringing the temporary arrangements mentioned above to a conclusion, and for providing the Society with suitable premises of its own.

"There has at the same time arisen amongst the general public a desire, which has found expression in the gardening press, for a central Hall for Horticulture—a desire, in fact, for the centralisation of all horticultural associations, benevolent institutions, &c., round the Royal Horticultural Society as a centre. The Council of the Society have, therefore, determined to proceed at once in this matter, for which, if only the command of a sufficient sum of money can be obtained, all things seem ripe.

"In looking out for a site for the proposed buildings, three things are essential:—(1.) It must be in a central position in London. (2.) It must be easy of access by road and by rail. (3.) It must possess abundance of light. Unfortunately these three essentials are exactly those which give to any site which possess them the greatest monetary value, but, being of such absolute necessity for the purposes of the Society, the Council feel that they must grapple with the fact of a very high ground-rent if the result is to be in any real sense satisfactory or worthy of our ancient Society and its thoroughly national objects. One or two such sites have been suggested, but, as was anticipated, the ground-rent is in each case very large, and constitutes the only grave difficulty to be surmounted. The Council do not, however, despair of success, if all the Fellows of the Society will join with them in making a united effort to overcome it. For this purpose the following scheme has been proposed by Baron HENRY SCHROEDER, and was explained by him at the general meeting of the Society, held on February 11, 1890.

"It is proposed to invite all friends of horticulture to join together in placing in the hands of three Trustees (of whom Baron SCHROEDER is willing to be one), a sum of £10,000, to be held by the Trustees free of interest, for the benefit of the Society, and to be gradually returned to the lenders by annual drawings of the bonds which they will receive from the Trustees—the drawings to commence, it is hoped, two years after the opening of the new buildings.

"Of this sum of £10,000, the greater part would be invested by the Trustees in first-class securities yielding interest, and the remainder would be invested in the buildings to be erected, the Society paying rent for them, and the total of interest and rent thus received by the Trustees would suffice for the payment of the ground rent. It is hoped that a considerable sum would be annually obtained for the purpose of redemption of bonds by letting the basement and the great hall itself for various purposes at times when it was not required by the Society.

"Thus the lenders will see that the sum invested by the Trustees, together with the value of the buildings erected, would form ample security for their money, and the only loss to themselves would be that of the interest during the period between their placing the money in the hands of the Trustees and the date of the drawing of the bonds they will hold in its stead. That the matter can be carried to a successful conclusion the Council are amply assured if all lovers of horticulture will join together to lend the money required.

"Hoping that we may receive your hearty sympathy and active support, W. WILKS, Secretary, R.H.S."

CYPRIPEDIUMS SPICERIANUM AND C. MORGANÆ.—Our Supplementary Sheet gives illustrations of two fine examples of the favourite genus *Cypripedium*—*C. Spicerianum* and *C. Morganæ*—the former from Mr. T. Coomber, The Hendre Gardens, Monmouth, and which may probably be considered the finest specimen of *C. Spicerianum* ever grown in a 60-size pot; and the latter from a photograph of a specimen of *C. Morganæ* in the collection of Norman C. Cookson, Esq., Wylam-on-Tyne, and which for beauty and profusion of flower it would be difficult to excel. *C. Spicerianum* appeared with Mr. Herbert Spicer at Godalming some twelve years ago, and its native habitat was for a long time unknown; but a few years ago this was discovered, and large quantities were imported, so that at the present time it is very plentiful in collections, and a general favourite. *C. Morganæ* affords an illustration of the energy displayed by Orchidists in making use of the material at hand to produce by cross fertilisation new varieties. Originally raised in the nurseries of Messrs. JAS. VEITCH & SON, by crossing *C. superbiens* (Veitchii) with *C. Stonei*, its inflorescence of natural size was illustrated in our columns, August 21, 1886, from a plant grown in Baron Schröder's collection. Since that time it has been raised independently by others, and has flowered with Sir TREVOY LAWRENCE, at Burford, and now again with NORMAN C. COOKSON, Esq., whose plant, affording a good idea of the floriferous character of the variety, we now illustrate. It will be seen that the flowers of *Cypripedium Morganæ* have a curious resemblance to those of the famous *C. Stonei* platytenium, which appeared among some imported plants of *C. Stonei*; but the leaves, exhibiting traces of the darker veining of *C. superbiens*, are very different from the plain green ones of *C. Stonei*.

THE MINISTER OF AGRICULTURE.—It is as well to remember that the Minister of Agriculture is Minister for Horticulture and for Forestry also. The gardeners and fruit growers may exercise some influence in case of need, either independently or by putting pressure on the Royal Horticultural or Royal Agricultural Societies as the accredited representatives of their several arts. In a recent debate in the House of Commons, we note that Mr. PICTON called attention to the large importations of Apples from foreign countries. The new Minister,

CYRTOPOGON N. HEBERLEYI.

CYRTOPOGON MOENCHII.

Mr. CHAPLIN in reply, said:—"I do not, perhaps, attach so much importance to the cultivation of fruit as the hon. gentleman appears to do; undoubtedly all those matters are entitled to and are, in fact, at the present time engaging the careful consideration of the Board of Agriculture. Fruit cultivation is a matter which we are now considering in connection with the question of agricultural education, but let me give one word of caution on this subject. It must be remembered that the cultivation of fruit depends perhaps more upon climate than upon anything else, and there we stand unquestionably, with the exception of some favoured districts, at a disadvantage as compared with many other countries of the world." We are afraid that neither the questioner, nor the Minister fully appreciate the bearings of the case. The weather is not the only thing to be considered, indeed, in some cases, bad weather may be beneficial to the growers by ensuring higher prices.

LINNEAN SOCIETY.—At the meeting held on Thursday, February 29, W. CARANTER, F.R.S., President, in the chair, Messrs. W. Eagle, Clarke, and J. H. Veitch were admitted, and Mr. James Jack elected Fellows of the Society. Mr. G. C. Druce exhibited specimens of *Agrostis canina* var. *scotica*, and a small collection of flowering plants, dried after treatment with sulphurous acid and alcohol, and showing a partial preservation of the natural colours of the flowers. Mr. F. P. Pascoe exhibited a series of Coleopterous and Lepidopterous insects, to show the great diversity between insects of the same family. The Right Hon. Sir John Lubbock, Bart., M.P., P.C., then gave an abstract of four memoirs which he had prepared: (1.) On the Fruit and Seed of the Juglandia; (2.) On the Shape of the Oak leaf; (3.) On the Leaves of Viburnum; and (4.) On the Presence and Functions of stipules. An interesting discussion followed, in which Mr. J. G. Baker, Mr. John Fraser, Mr. D. Morris, and Professor Marshall Ward took part.

—An evening meeting will be held on March 6, at 8 P.M., when the following papers will be read: 1. On the production of seed in some varieties of the common Sugar Cane, *Saccharum officinarum*, by D. Morris. F.L.S. 2. An investigation into the true nature of callus.—Part I. The Vegetable Marrow, and *Balia callitricha*, by Spencer Moore, F.L.S.

DR. GILBERT, who, in connection with Sir JOHN LAWES, has devoted a life-time to the elucidation of the principles on which agriculture is based, is to be honoured, or rather the University of Edinburgh is going to confer honour on itself, by the conferment of the degree of Doctor of Laws on the celebrated agricultural chemist of Rothamsted. The Right Hon. H. CHAPLIN, who has only just put the harness on as Minister of Agriculture, is to receive the same degree.

A GIGANTIC ORCHID.—A paragraph relating to a large plant of some Orchid has lately been "going the rounds" of the press. In relation to it C. KEYSER, Esq., Warren House, Great Stanmore, Middlesex, sends us the following letter, which is written by his nephew, Mr. A. KEYSER, Resident Magistrate at Selangor:—

"It may interest some of your readers to hear of one of the largest Orchids that has ever been seen in this country. I noticed it on a very high tree (Durian tree), while riding some 14 miles from my house. It formed a complete circle round the tree, the Durian fruit being much valued by the Malays, I was not inclined to purchase the entire tree for the sake of the Orchid, and therefore, perhaps, did not obtain it in as good condition as I otherwise could have done. I ordered the plant to be scraped off and brought to the house. It took fifteen men to move it. The Orchid is now in my garden. It is 7 ft. 2 in. high, and 13½ ft. across. It has seven spikes of flowers, the longest 8 ft. 6 in. The blossoms are a dark brown, spotted yellow. As it is very seldom that any European visits this part of the State

the Orchid does not get as much admiration as it deserves, the Malays thinking my appropriation of it rather an insane proceeding, as the blossoms are not good to eat.—Yours, &c. ANTHONY KEYSER.

"Kuala Kubu, Ulu Selangor, Selangor, Straits Settlements, January 5."

It would appear to refer to a species of Grammatophyllaceae, the most agreeable better with the description of the Orchid we can think of, but the species necessarily remains doubtful. Will Mr. KEYSER kindly send a specimen of the plant and forward it, so as to enable us to satisfactorily determine the species? The same gentleman mentions a somewhat remarkable prolific Pine-apple. He describes it as "about 1½ ft. long, and from its base stand out at right angles ten perfect Pines of 8 inches each.

THE ROYAL HORTICULTURAL SOCIETY.—The Society has been of late years, from one cause or another, signally unfortunate in its Assistant-secretaries; we are, of course, not alluding to its honorary officers, but to the paid officials. There seems now a chance that the post and the man will be better suited the one to the other than heretofore. Mr. JOHN WEATHERS, who has been appointed to the post, has manifested energy and perseverance to a remarkable extent; he has a sound knowledge of practical horticulture and botany, and of their requirements; he is a linguist, and a capable draughtsman. He was formerly at Kew, but lately he has been with Messrs. SANDER & CO., of St. Albans, and has been, since the death of Professor KRICHENBAUM, largely concerned in the editing of the *Reichenbachia*.

MALFORMED CATTLEYS.—A correspondent at Beckenham obligingly sends us fine flowers of *Cattleya Triana*, all similarly malformed. In all the ovary and ovules were absolutely wanting, the cavity of the ovary being replaced by a tube prolonged downward from the style, and lined with a purple lining. The three sepals were normal, but in every case the lateral petals were adherent to the column. In some cases the petals bore traces of anthers on their edge. The lip and column were mostly normal, except in size. Our correspondent asks, "Can you account for it in any way?" Well, yes: we can. The appearances are the consequence of a check to growth or arrest of development. Further than that we cannot go. How, why, when the check came is more than we can say. The plants are reported to be quite healthy.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The prize schedule of this Society has just been issued for the grand floral *fiore* of 1890 and spring show of 1891. It is much bulkier than usual, and contains a lot of new matter. The patron is H.R.H. the Prince of Wales. The honorary President is the Lord Provost of Aberdeen, and the Chairman of the Acting Directors, Mr. JAMES MURRAY GORDON, Advocate, Aberdeen. There are four divisions for competition at the *fiore*:—(1.) Professional gardeners; (2.) Nurserymen and florists; (3.) Amateurs; and (4.) Working men. There are 722 prizes offered at the *fiore*, which is fixed for August 21, 22, and 23. The spring show will be in April, 1891, on a date to be afterwards fixed.

THE HEATHER.—Every one knows how common a plant the Ling (*Calluna vulgaris*) is in this country in suitable situations from John o' Groats to Penzance. The plant is, however, extremely rare on the North American continent, where it has only been found in a few localities, and then under circumstances which, for the most part, forbid it being considered as wild. "Here and there," says Professor GOODALE, in *Garden and Forest*, "it has been found in small amount, but it has had only a precarious hold on the soil, with no assurance that at any place as yet unvisited our botanists will find it well established. . . . We have in such a study of Heather in a New England pasture a capital illustration of the paucity of simple facts at one's command. What we do know is the following:—A

common plant, wild in a soil and climate much like our own, refuses under the ordinary conditions of the struggle for existence to make even a pretence of holding its ground when it comes here. What no one knows is the following:—Whether the conditions here of heat and cold, dryness and moisture, insect visitants, competing shrubs and herbs, grazing animals, and the like, are so nearly favourable that, with a trifling change one way or the other, they might serve the plant well, and give it here an open welcome." Dr. GOODALE does not tell us if the plant is found to be difficult to cultivate in American botanic gardens or nurseries. [We have grown a patch of it for the last twenty years on the London clay with no peat but with a little road-sand, intermixed. Ed.]

COPROSMA BAUERIANA.—Has any one tried this handsome evergreen shrub by the sea coast in the south-west of England or Ireland? It seems likely that it might succeed in such localities, as it is said, in Kirk's *Forest Flora of New Zealand*, to resist the force of the fiercest gales, and to develop its beautiful foliage in situations where it is often washed by the spray. Variegated forms are known. In this country we have only seen it in conservatories, but it must surely be as hardy as *Grissinia littoralis*.

THE AMERICAN FLORISTS' COMPANYS' DIRECTORY.—We have received a copy of this new Directory, which contains a list of florists, nurserymen, and seedsmen of the United States and Canada, classified according to the States. We have no doubt but that it will prove of service to those having trade relations across the Atlantic. The American Florists' Company's address is 51, La Salle Street, Chicago, U.S.A.

SHOW FIXTURES.—We have received a schedule of prizes offered at shows to be held by the Royal Aquarium Co. during this year. The dates are March 12 and 13, April 29 and 30, May 21 and 22, June 27 and 28, July 29 and 30, September 10 and 11, October 15, 16, and 17. There are, in addition, the already announced exhibition of the National Chrysanthemum Society. Mr. W. HOLMES, Frampton Park Nurseries, Hackney, is managing the series.

LATENT LIFE IN FERNS.—M. BEURAT, in the last number of the *Comptes Rendus*, cites an instance of reviviscence (coming to life again) in a Fern, *Polypodium incarnum*. This is not a case simply of absorption of water to such an extent as to restore the form shrivelled by drought, as in the so-called Rose of Jericho, but an actual awakening from a dormant to an active state, such as happens when a seed germinates. The drying and shrivelling of the fronds in these cases does not necessarily imply death, for, if vitality be only arrested and not destroyed, the fronds literally come to life again when placed under favourable conditions. The other plants thus known literally to revive, excepting those in which the change of form is due to mere turgescence, are *Selaginella lepidophylla*, *Cochlearia officinarum*, *Asplenium Rutamuraria*, *Polypodium vulgare*, *Cheilanthes odora*, *Asplenium lanceolatum*, *Adiantum capillus-veneris*. The late Mr. DANIEL HANBURY exposed some of these plants to a temperature of 66° C. = 150° F. without injury. No flowering plant has been known to revive in this remarkable manner.

THE GOOD-LUCK LILY.—The introduction of this bulb from China has been a distinct boon to amateurs. Its extremely rapid growth is watched with great interest; the foliage alone is vigorous and handsome, and the flowers by no means unattractive. We are so much accustomed to think of *Narcissus tazetta* as a South European plant, that its appearance in China has suggested that it was taken to that country, perhaps, by the Portuguese. But the fact that the legends have grown up around the plant, and that it has native Japanese names, go to show that it cannot be of recent introduction; indeed, SAVATIER, in FRANCEST ET SAVATIER'S work

on the *Flora of Japan*, distinctly states that it is assuredly wild in Japan. Mr. BAKER, moreover, has kindly called our attention to a figure in the Japanese work entitled *Mokou Zoussets*. From Japan it might readily pass into China. Dr. ROERT, moreover, says a form of *N. Tazetta* is found wild in Turkestan, so that the distribution of the plant is much wider than is generally known.

PROPOSED WILDSMITH MEMORIAL.—We learn that the Reading Gardeners' Association, of which body the late Mr. WILDSMITH was a member, have appointed a special committee for the purpose of promoting the proposed memorial to Mr. WILDSMITH. This it is desired to accomplish by placing a child on the Gardeners' Orphan Fund by the subscribers to the memorial. The memorial would thus be of a terminable nature, and the sum required will not exceed £130. W. J. PALMER, Esq., the President of the Gardeners' Association, has consented to act as chairman; ARTHUR J. S. TROT, Esq., to be the Reading treasurer; and H. J. VEITCH, Esq., the London treasurer; and Mr. TERTON, of Maiden Erleigh Gardens, is the secretary. It is earnestly hoped that there will be a ready response to this appeal by all the gardening friends and admirers of the late Mr. WILDSMITH throughout the United Kingdom; and the committee have ventured to suggest that as Mr. WILDSMITH had promised his friend Mrs. Hyde that he would aid to the utmost in placing a second child of hers on the Fund (one having been already placed thereon through his instrumentality), they cannot do better than endeavour to carry out his wishes, and they trust that a promise made under such touching circumstances will commend itself as the most fitting form of memorial that can be adopted.

CHISWICK HORTICULTURAL SOCIETY.—The annual summer show has been fixed to take place in the Royal Horticultural Society's Gardens on Thursdays, July 10 next.

"WHAT TO EAT, AND HOW TO COOK IT," is the title of a useful little pamphlet published annually in connection with the "Apple-Tree" Vegetarian Restaurants. The copy here contains many most appetising receipts, while some of the substitutes for the forbidden snet or dripping are very ingenious. We are told that, instead of the former, vegetarians can sop bread-crumbs in batter or oil, or add a "little crushed and soaked Tapioca to the paste used for boiled puddings." Is it prejudice alone which makes us disinclined to change our own tried receipt for a Christmas pudding for one, in which, although the ingredients altogether weigh rather less than 6 lb., is yet to contain 1 lb. of mashed Potatoes, or 8 oz. of mashed Carrots? How do vegetarians reconcile the eating of eggs with their resolution to destroy no animal life for food? In spite of all we have said, we can only repeat at the end of this notice the words we said at the beginning—many of the recipes are excellent, and likely to be useful to many besides those for whom they are more especially intended.

NATIONAL CHRYSANTHEMUM SOCIETY: CENTENARY FESTIVAL.—His Grace, the Duke of WESTMINSTER, has sent a donation of £5 to the Special Prize Fund, and given permission for his name to be announced as a patron of the same. The publication of this fact, and of the circumstance that the committee would place at the disposal of every society affiliated to it a special centenary medal, free of cost, is having the effect of inducing horticultural societies to become allied to the National. Since the last meeting of the Committee, applications to affiliate have been received from the Bacup, Batley, Market Harborough, and Hartlepool societies.

NEW GARDEN FOR H. H. THE GAEKWAR OF BARODA.—We take from the *Times of India* the following particulars of the work in course of execution under the superintendence of Mr.

GOLDRING:—A new palace is in course of construction, and it is the GAEKWAR'S wish to provide this jewel of architecture with a proper setting, and to this end he has secured the aid of Mr. GOLDRING, of the Royal Horticultural Society of England, who is now hard at work turning the formerly jungly grounds into what is to be the finest garden in India. There are at the Moti Bagh many groups of fine trees, and Mr. GOLDRING has been careful to protect every one of these from harm. The approaches to the house are being cleared of all excrescences, such as servants' quarters, and the hundred-and-one offices and shanties which grow up like Mushrooms round Indian houses. The levels are being mostly sloped away from the palace, so as to throw it up and give it greater height. Too straight lines are broken up into undulations, and where trees are wanted they are introduced, full-grown forest trees being boldly transplanted and brought here from a distance.

Outside, Mr. GOLDRING has thrown up a great bank at one end of the garden, which blocks out a public road, and in another part he is planting out an ugly mass of stable building, which can go nowhere else, but which must be hidden. Nothing seems impossible to Mr. GOLDRING. Everything comes in useful. A jutting rock becomes the centre point for a cool grotto, where trickling streams drip over Fern covered walls, and find their way through one rocky chamber after another cut into the sunshine. Give him a dry nullah, and, by the end of a week, you will find it changed into a river, whose rocky banks are covered with creepers and waving grasses; and if, attracted by the noise of a waterfall, you go up the stream, you will find the water tumbling over great piled-up boulders, where a few days before there was nothing but a crumbling earthenbank. By the end of a few more seasons, Makarpara will be hardly recognisable. The gardens are already so far planned out that one can see their scope. In a very short time the Bagh will look like an English park, and where now there is nothing but bare maidan, there will be fair gardens and fountains, ornamental waters bordered with Palms and Bamboos, lawn and shrubberies. One garden is to be so terraced and sunk, that her Highness the MAHARANI will be able to walk and rest there unseen by the outer passing world.

ORCHIDS.—The eighth and ninth parts of *Orchids, their Culture and Management*, by Mr. WATSON of Kew, assisted by Mr. BRAY, have been published. The arrangement is alphabetical, and the work has now advanced as far as *Promenaea*, and is in course of translation into Russian. Under *Pleione*, we observe that Mr. WATSON who rather prides himself on his empiricism in matters of cultivation, begins by telling his readers that the species have fleshy pseudobulbs, of annual duration and deciduous leaves, that they are natives of the mountains of India, and may be termed distinctly alpine, some of them growing where snow and frost sometimes occur. They are found in great abundance clothing the trunks of trees, and clinging to moist rocks in positions exposed to full sunlight. Surely, here, Mr. WATSON has supplied most valuable hints for the cultivator, derived, not from empirical experience, but from the structure and habit of the plants themselves and the conditions under which they grow. The consequence of a disregard of these plain teachings is, as Mr. WATSON says that "many growers fail with them, through giving them tropical treatment and excessive coddling." Growers in possession of the knowledge that Mr. WATSON indicates above, must be very empirical indeed, if they adopt such practices, the only excuse for which would be sheer ignorance.

BIOGRAPHICAL INDEX OF BRITISH AND IRISH BOTANISTS (continued from p. 203):—

* MATHEWS, ANDREW (d. 1841): d. Chachnopoulos, Pera, 24th Nov., 1841. A.L.S., 1825. Gardener at Chiswick. Collector in Pera and Chili, 1833—1841: drew many of the plants he collected, Proc. Linn.

Soc., i., 173; Laségue, 255; R. S. C. iv., 282; Comp. Bot. Mag., i., 17, 395; Journ. Bot., 1834, 176; 1842, 392. *Mathewsia* Hook. & Arn.

* MATON, WILLIAM GEORGE (1774—1835): b. Salisbury, 31st Jan., 1774; d. Spring Gardens, London, 30th March, 1835; bur. St. Martin's-in-the-Fields. B.A., Oxon, 1794. M.A., 1797. M.D., 1801. F.R.C.P., 1802. F.L.S., 1794. F.R.S. "Uses of Pinus," in Lambert's 'Pinus,' pp. 65—82. 'Natural Hist. . . of Western Counties,' 1797. 'Animals and Plants Round . . . Salisbury,' in Hoare's 'South Wiltshire,' p. 654. 'Nat. Hist. Wilts.' (posth.), 1843. Jacks., 259; R. S. C. iv., 285; Biog. Sketch, by Dr. Paris, 1838; Smith Lett. ii., 121; Monk, iii., 6; Nich. Illust. viii., p. xlv.; Gent. Mag., 1837, i., 173. Monument, Salisbury Cathedral. Bust at Linn. Soc. Portr. at Kew and at Royal Coll. Physicians. *Matonia* Br.

* MATTHEW, PATRICK (fl. 1831). Of Errol, Scotland. 'Naval Timber and Arboriculture,' 1831. Jacks., 207; R. S. C. iv., 294.

* MAUND, BENJAMIN (1790—1863): b. 1790; d. Sandown, I. of Wight, 21st April, 1863. F.L.S., 1827. Druggist and bookseller at Bromsgrove, Warwicksh., Contributed to *Phytol.* i., 45. 'The Botanist' [with J. S. Henslow], 1837. Proc. Linn. Soc., 1863—64, xxx.; *Phyt.* 210; Jacks., 579; 'Botanic Garden,' 1825 (original drawings in Bot. Dept., Brit. Mus.).

* [MAWLE, THOMAS. Gardener to Duke of Leeds. 'Universal Gardener and Botanist,' published in his name, but written by John Abercrombie, 1778. Johns. Gard. Dict., 200, 222.]

* MAXWELL, G. (1805?—1880): b. 1805?; d. King George's Sound, 1880. Collector of plants and insects in Australia for thirty years; *Gard. Chron.* 1880, i., 433. Fl. Austral. i., 14. *Erlostium Maxwellii* F. v. M.

* MEN, MARGARET (fl. 1790). Botanical artist. 'Exotic plants from Royal Gardens at Kew,' 1790.

* MELLER, Charles James (1836?—1863): b. 1836; d. Berriola, Sydney, 26th Feb. 1863. M.J.R.C.S., 1857. F.L.S., 1867. Travelled in Africa with Livingstone, and in Madagascar. Superintendent, Bot. Gardens, Mauritius. Plants at Kew. Journ. Bot., 1869, 212; R. S. C. iv., 330; Proc. Linn. Soc., 1869—70, cii. *Mellora* S. Moore.

FLORA OF PARAGUAY.—M. MARC MICHELI has published in the memoirs of the "Société de Physique et d'Histoire Naturelle," of Geneva, a further account of the Leguminosae collected by BALANSA in Paraguay, and Dr. CROBAT a similar account of the Polygalaceae. Both memoirs are accompanied with lithographic illustrations.

CAMELLIAS AT MESSRS. C LEE AND SONS' NURSERIES.—There are few nurseries now in which a collection of these beautiful hardy, or nearly hardy, evergreen shrubs is grown. They are evidently not a fashionable flower; and yet with proper attention as to management, a regular succession of flowers may be obtained from October until July. Perhaps bud-dropping may be taken into the reckoning to account for this comparative neglect of such a useful decorative subject, the remedies for which evil have been so well placed before readers in these columns recently. At the Isl-worth nurseries most of the best of the older varieties, and also the newest, are grown. Amongst the former may be mentioned *Mathotiana alba*, large flowers, finely imbricated to the centre. Another good, pure white is *Lavinia Magg*, a flower of fine form and substance. *Leeana superba*, flowers salmon red, very fine. *Valtevarado*, a bright rose-coloured flower, of fine form; a flower of excellent form is *Wilderi*, colour soft rose; *Reine des Fleurs*, colour vermillion-red, striped with white; imbricata, deep carmine, sometimes variegated; *fimbriata alba*, a variety much in request, and somewhat resembling *alba pleno*; *Reticulata flore-pleno*, fine large double flowers, bright rose; *Princess Clotilde*, a beautifully striped flower. Of new ones, mention may be made of *Napoleon III.*, a beautiful variety; flowers rose, veined with deep rose, and edged with pure white, a flower of good substance,

FOREIGN CORRESPONDENCE.

CYPRIPEDIUM CALLOSUM AND ITS WARTS.

I HAVE NOT understood the notice which appeared in your number for February 15, under heading "Cypripediums from Liverpool," at p. 198. The writer says:—"The bearing warts on the upper side only of the petals of *C. callosum* make a feature which distinguishes it from *C. barbatum*." My experience is the exact reverse. I have a very fine form of *C. callosum*, which attracted the universal admiration of the connoisseurs at the last meeting of the Royal Tuscan Horticultural Society, and which has the large black warts scattered over the whole surface of the sepals, which gives it a very striking appearance. An inferior plant was exhibited at the same time, in which the warts were confined to the upper edge of the sepal.

I have, on the other hand, remarkably fine varieties of *C. barbatum*—so fine that they have been bought and taken to England by leading orchidists for the purpose of hybridisation. In these the warts are only on the upper side of the petals, and never on the lower. To me the two plants *C. callosum* and *C. barbatum* are so entirely different, that I should have thought no especial feature was necessary to distinguish them from one another at a glance; at all events mine are utterly different. *H. J. R. S., Poggio Giordano, Via Sottopiano, Firenze.*

BERLIN.

At the last meeting of the Horticultural Society, Mr. Choné exhibited a dozen of *Amaryllis* and also of *Freesia refracta alba*. The *Amaryllis* were of a remarkable culture. Flowers, as many as five upon one scape, very large, of fine colour. Most of the bulbs two-scaped. Leaves very healthy and strong. As to the cultivation, the exhibitor remarked that the bulbs are cultivated in pots and kept dry until the flower-scape appears, and has reached a length of about 2 inches in a hothouse, where the Lilies of the Valley (*Convallaria majalis*) are placed. Here the leaves, as well as the flowers, are very well developed. It is curious to see how low the price is for really first-class flowers, viz., 50 pfennige a flower (sixpence!).

Another curious fact is, that it is very difficult for Berlin gardeners to bring novelties into the market. As an illustration, take the *Freesia*. A nurseryman last year cultivated some thousands of them, but as he could not find buyers for them, he gave up the cultivation. The exhibitor in the horticultural society said the same thing. He could not advise the cultivation of the plant, though it gives no trouble, and the single flowers, as well as the whole inflorescences, might be used with much effect in arrangements.

Of great interest was the debate on the question, How may peat moss litter be used in gardening? The price of straw is so high here that many stable-keepers make use of turf, or better, peat, instead of straw. It is much cheaper, and gives some other advantages, as the horses remain always clean, the stable odour vanishes, &c. This peat-moss cannot be used for hot-beds, as it gives a very high warmth, which is soon dissipated; but it is most useful as manure, as it soon condenses the ammonia. Both in pot culture, where it is mixed with the same quantity of earth, as well as in the open air, it is of the highest value. It was especially recommended for *Asparagus*—one year peat, the next kainit. It was also recommended for heavy soils, as it makes them looser. For sandy soils, opinions differed. Some of the members said that it dries the soil; others said the contrary. It was also remarked that from the peat the sandy soil receives organic substances.

Another question discussed was the question, How the *Asparagus* beetle may be expelled from the *Asparagus* plantations? These plantations, which occupy a large area in the neighbourhood of Berlin,

suffer very much from that insect. The best remedies are, to put Willow twigs smeared with a viscous fatty material upon the beds, about 6 feet apart, in April and May, when the insect flies, and to cut every shoot of *Asparagus* during that time which appears; secondly, to burn all the *Asparagus* plants in autumn. The flying insects are caught by the viscous Willows in enormous quantities, so that it is often necessary to replace them. The remaining insects find no plant upon which they can lay their eggs. *Our Berlin Correspondent.*

NURSERY NOTES.

MESSRS. F. SANDER & CO., ST. ALBANS.

THE early part of the month of February is not the best time of year for seeing flowering Orchids, though in large collections objects of interest may be found even at that dull season. Accordingly, the other morning found me en route for the now famous St. Albans nurseries, where may be seen the largest collection in existence of these plants. In looking through the different houses one can hardly help wondering where the plants all go to. But they do go, and this alone affords some idea of the extent and importance of the industry of Orchid importing and growing. The plants, for the most part, are in robust health, with fine plump pseudo-bulbs, and dark green leaves, which tell their own tale; and there can be little doubt that the clear air and absence of fog are valuable aids to the high cultivation carried on there. It was a somewhat novel sight to see *Odontoglossums* planted out in beds and thriving under the treatment—pseudo-bulbs and foliage leaving nothing to be desired. Many plants were in flower of the charming little *O. nevium*, *O. gloriosum*, *O. Sanderianum*, and various forms of *O. saccatum*, or some very closely allied species. *O. Harryanum* was also observed, and a very pretty little natural hybrid which seemed to be intermediate between *O. Sanderianum* and *O. odoratum*, or some close ally, but which did not appear to have any special name. Plants of many other well-known kinds were also out, and there was ample evidence that in a few weeks' time there will be a magnificent display of bloom.

Cattleya amethystoglossa is a valuable winter flowerer, and there were many plants of the species in fine condition, and bore large trusses of flowers, the light rosy-spotted segments of which formed a charming contrast to the bright amethyst-coloured lip. *Oncidium splendens* was observed in quantity and in fine condition. Close by was one of the finest *Lycaste* *Barringtonia grandiflora* or *L. costata* that I ever remember to have seen. The plant had thrown up a dense mass of ivory-white flowers of large size, the lip beautifully fimbriated. Several plants of the pleasing *L. Skinneri alba* were also in flower. Many large specimens of *Cologne cristata* and of the beautiful variegated *Lemonium* were complete masses of bloom, while equally floriferous was a somewhat intermediate variety with very straggling growth—or, perhaps, it would be better described as a form with much elongated rhizomes and distant pseudo-bulbs, for the term straggling, as generally understood, could not well be applied to the plant. In size and colour it partakes much of the character of the variety *Lemoniana*, but at the base of the lip is a deep yellow spot, just as in the typical form. It appears to be a constant and well-marked variety, for there were several large plants, and each had precisely the same character. In one of the houses was a healthy batch of plants of the pretty little *Phaius Humblotii*, just throwing up their flower-spikes. It is often reported to be a somewhat mildly grower, although there was little evidence of this in the plants observed. Several hybrid *Cypripediums* were in flower, of which *C. × Godaeffianum* and one named *C. × Harrisonianum picturatum* were worthy of note. The former is a very handsome little plant, whose descent from *C. hirautissimum* and *Boxallii* could not be more plainly written on its face; while the latter is a highly curious variety, in

which the markings are arranged in longitudinal streaks and splashes. It did not strike me as being much of an improvement, although it might possibly lead to something finer if it were taken in hand.

Several fine plants of *Dendrobium Wardianum* were flowering most profusely, and among numerous plants of the welcome *D. nobile* was a very fine form of the singular variety *D. n. Cooksonianum*, in which the two petals are more or less metamorphosed into lips. The above are some of the notes taken during a somewhat hurried visit, but the place is one to be seen rather than written about, so extensive is it. The seedling Orchids are a very interesting department of this nursery, and amongst them are many crosses of great promise, which will probably be heard of in the near future; but this department, however, interesting as it is, must be left over for a future visit. A.

PRIMULAS AT WOODSIDE.

MR. James, whose name once more appears on the list of the Floral Committee of the Royal Horticultural Society, has not been a prominent exhibitor at the meetings of late, but away in the elevated corner of Bucks on Farnham Royal Common, and near the famous Barnham Beches, he has erected some 500 feet of capital 12-foot span roof-houses, and there, in a delightful atmosphere, pure and sweet, he cultivates his favourite old florists' flowers—Primulas, *Cinerarias*, *Cyclamens*, and *Calceolarias*, to a large extent. Primulas, to the extent of some 1200 fine plants, are in bloom now; *Cinerarias*, to the number of 2700, will make a beautiful show some two months hence; and *Calceolarias*, looking this year wonderfully well, a month later. *Cyclamens* will be in full bloom a month hence, as these are not pushed on early. Of Chinese Primroses, the whites the Farnham is very fine indeed. There are three specially striking kinds: White Perfection, one of the Swanley strain, on dark fern foliage; Parity, a beautiful white on semi-coloured leafage; and Snowflake, one of the latest certificated at South Kensington, on light green foliage; all these have flowers of the purest white. The old market white, still largely grown, is very floriferous, but lacks size and purity, as compared with the blooms found in later strains. As evidence of the progress being made in development of size in bloom, was a seedling in dark fern leafage, the flowers pure white in colour, which, whilst very stout, were of great size—indeed, finer I have never seen. The plant will probably develop a progeny of giants, and it has been named Woodside Giant; while, very pretty indeed at Woodside is the Blue Primula. Seen in the bright sunlight, it has the hue of the *Plumbago capensis*, and shows that we are much nearer to blue in the Primula than is usually admitted to be the case; we always need bright, light to show the full beauty of some colours in flowers, and blues especially suffer in dull light. A batch of seedlings from one cross shows several shades of rose, and carmine on light and dark foliage, both of thick form and Fern-leaved; when the fertilisation is restricted to sort, the product is almost always very true to character; crosses, however, produce new forms, and exceedingly interesting is it to watch these opening. Carmines of the old style, fade or turn both in damp air and in bright sunshine, but newer carmines not only show more body of colour, but retain their colours without blemish to the last. That is especially the case with Woodside Rose, a rich carmine form; Ruby King, a deep magenta-hued form of flower borne in clusters on small foliage, seems almost to belong to a diverse family from that of the ordinary Chinese Primrose, and yet it is very beautiful. Very rich are the blood-red selections from the Chiswick red strain. These seem to need only enlarged size to render them perfect, more brilliant self colours it seems impossible to obtain. Specially deep coloured is the Double Crimson, really a semi-double form, wonderfully free and striking, and beautiful is its pure white semi-double compeer. Both these give first-class flowers for bouquet making in the winter, and comes perfectly true from seed. A very fine white-edged variety of the singles

is Mary James, the ground colour being of a reddish lilac. Primulas at Woodside grow very robust and compact habit, the product of plenty of light and air. The Cinerarias later will make a very fine show. More than three-fourths are seedlings, but still coming true to character from seed, ample evidence that in seed production the greatest care is exercised to secure trueness to colour. *A. D.*

THE GIANT SNOWDROPS.

ONE of the minor miseries of my life is having to live in a garden containing thirty distinct kinds of Snowdrops, and not being able to boast of possessing *Galanthus Fosteri*, the "giantest," and, so far, the most to be desired of them all. Still, I live in hopes, since we are told that "all things come to those who know how to wait."

Herewith I send specimens, flowers and leaf, of the following kinds:—The Shaylock variety of *G. Nivalis*, with two green leaves on the flower-stalk (fig. 43), *G. Elwesi*, *n*, in fig. 41, the real original stock from Smyrna, and one of the Snowdrops to grow and admire. Its slight constitutional delicacy is its only drawback, but as seen at its best, it is a big and noble thing.

G. Imperati (fig. 42, p. 269), from Straffan, co. Kildare, is another noble variety, and the tradition is that roots of it were originally brought to Ireland by Lord Clarina on his return from the Crimea in 1856. It would be interesting to hear the breadth of distribution as enjoyed by *G. Imperati*, as it seems most generally imported from Naples, although under the name of *G. umbricus*, a form of *G. Imperati* has recently come to us from the Umbrian Mountains in Central Italy.

One of the handsomest of all our Snowdrops is *G. plicatus elegans*, a seedling raised at Shepton Mallett, and presented to us by Mr. Jas. Allen, who is the best English authority on these delightful flowers of the autumn and the spring. I mention the autumnal kinds, as they are less well known. They are:—*G. octobriensis*, *G. Olge*, *G. Rachelæ*, *G. Else*, and one or two others, all of which bloom from October to December. But to return to *G. plicatus elegans*, it is a real beauty, and very distinct from the typical Crimean Snowdrop, in its deep green markings extending to the full length of its inner perianth divisions.

One of the rarest of all the spring Snowdrops is *G. lutescens*, but it is good news to hear that Mr. Boyd, another lover of these flowers, has found a finer yellow kind, which has a better "constitution," and is to be called *G. flavescens*, I believe. Then another friend writes that he is on the track of a pink or rose-flushed form of *G. nivalis*, and I hope some day to see its bloom, for a rosy Snowdrop will be a novelty, even if not more beautiful than the white type. It will be an analogue of the rosy Lily of the Valley. In conclusion, I hope all the readers of these few notes who have distinct Snowdrops in their collections, whether native variations or garden seedlings, will be so good as to tell us of them, since there are now a good many of us deeply and seriously interested in these pearls of the opening year. *F. W. Burbidge.*

THE GREAT FERN-HOUSE IN THE BOTANIC GARDEN AT BRUSSELS.

This great building is composed of two sections in the shape of a T, the two portions having been built at different times. The part first built is more than 85 feet long, by 44 feet wide, and 31 feet in height; the other portion measures nearly 79 feet long, 33 feet wide, 43 feet high, the entire surface being more than 6000 square feet.

This glass palace is warmed by two tubular boilers, one of which is only to be used in case of any accident happening to the first. Six stout pipes (about 3½ inches) are carried round the building to the place where a fourfold battery of pipes is arranged where the two sections of the house meet. More than this, to avoid the inconvenience caused by too great

condensation, a double row of pipes has been placed in the upper part of the house about 30 feet from the ground. The number of pipes is more than sufficient; it is never necessary to overheat, and over-dryness of the atmosphere is thus avoided.

The shading of the Fern-house is a most important point. It is managed by an arrangement of movable wooden blinds. Ventilation is also espe-

Cyathea medullaris, from New Zealand, is certainly one of the handsomest of Tree Ferns known. The Botanic Garden possesses several specimens, measuring from nearly 30 to 33 feet in height. Until it has attained a certain age, this species only puts forth one frond at a time; but when it is fully grown, the fronds are arranged in crowns. The effect produced is exceedingly imposing, and the

FIG. 41.—A, GALANTHUS Plicatus; B, G. ELWESI.

cially studied; even in winter the air can be renewed through apertures made in the walls behind the pipes; this air is warmed by contact with them, before it reaches the plants. Combined with the dampness produced by constant waterings, the atmosphere is such that the health and growth of the plants are good.

Although the Ferns from Brazil contributed chiefly by M. Binot, form the nucleus of this splendid collection, it contains also many others, some from Mexico, and some from Australia. We will specify a few.

blackness of the leaf-stalks is most handsome against the green background of fronds.

Specially noteworthy is *Cyathea princeps* from Mexico, several specimens of which measure about 30 feet in height; also *Cyathea Schanschin* (*sic*), a rarer species about 12 feet high; the trunk of this latter still bears very visible traces of the scars made occasionally by the fall of the fronds, the arrangement of which reminds one of the marks on the skin of a boa-constrictor.

These gigantic Ferns standing up near the entrance of the house, and forming a canopy of verdure,

make a great impression on the visitor, which is increased by the sight of the majestic Palms.

A fine specimen of *Anthurium ellipticum*, noticeable on account of its good foliage, towers above an ornamental support of cork; growing in a pot the roots were constricted, and have spread all about, perforating the cork on all sides, and looking like ropes ready to moor in the flotilla of gigantic leaves.

perforated; and the adventitious roots, which spring from the branches, are matted and twisted about in all directions.

Near this group is an *Alphophila hirta*. The base of the rachis of this Fern is very spiny, and the fronds are of more than usual size. One of the most remarkable plants in this rich collection is the *Cibotium regale*, from Mexico, introduced in 1863,

portioned, equally graduated, and forms an elegant support to the splendid crown which surmounts it. *Alphophila elegans* is a rare species, of which there are very few specimens in cultivation.

On the right hand side of the house is a rockery, which also contains many varieties, an *Areca sapida* rising from a clump of striped and spotted-leaved *Begonias* is very effective. Close by, over an arrangement of virgin cork, climbs a *Margravia* with small foliage, the adult leaves are green, and the young leaves red; it is similar in habit to *Ficus repens* and to *macrophylla*. The base of this is ornamented with Ferns, *Begonias*, Lycopods, and even Orchids. We noticed one *Begonia*, named after the Director of the Botanic Garden, M. Fr. Crépín. A collection, unique on account of the number and size of the specimens, is that of the Angiopteris and *Marattia*, which form an imposing group. Specially noticeable is a *Marattia Moorei*, with black petioles, and much cut leaves; in general effect the plant is most distinctive.

The *Marattia sorbilifolia* is one of the largest known species; another very fine species is *Marattia Verschaffelti*. The most remarkable Angiopteris in this collection are *pruinosa*, *hypoleuca*, *erecta*, *macrophylla*, *Willinkii*, and the finest of all, *A. Teymanniana*, with twenty to twenty-five leaves, covering a surface more than 300 feet square. *Microlepia platyphylla*, with glaucous leaves, about 6 to 9 feet long, is a remarkable species, which attracts much attention. The very rare *Dicksonia chrysotricha*, from Java, of which perhaps there are only three specimens in the country, is represented by a fine example of medium size, and with abundant leaves. Although reminding us at first sight of *D. squarrosa*, it differs from that species by the very dense reddish-brown down, and by the larger and less rigid fronds.

Passing to the recently constructed portion, we admire an *Alphophila armata*, which has a double very slender trunk nearly 40 feet high, supporting immense crowns. What a contrast to the *Dicksonia antarctica* of New Zealand, and *D. Sellowiana* of Brazil, the trunks of which form massive and thick columns. We also notice *Cyathia Gardneri*, a native of Brazil; *C. dealbata*, from New Zealand, with silvery fronds; the rare *C. Sternbergiana*, the leaf-stems of which are more than 22 feet high; *Cyathia princeps* and *medullaris*, *Balanians*, and particularly an *Hemitelia setosa*, the base of whose leaves is ornamental, with filaments resembling somewhat certain Hymenophyllum.

Among other plants which contribute to the ornamentation of this glasshouse, I must notice *Kentia Forsteriana* and *K. Belmoreana* of large size; *Livistona australis*, and many tall Aroids. The Bamboos are of great size, and have grown up since 1880 to the top of the house; the development of the young shoots of these Gramineæ has been so rapid that it could almost be seen with the naked eye. *Pandanus furcatus* and *Philodendron macrophyllum* form, with *Anthurium cucullatum*, *Musa*, and *Heliconia*, a worthy finish to this collection, which is one of the greatest features of the Botanic Garden of Brussels. In addition to the Tree Ferns, there is a fine collection of herbaceous species arranged along the rock-work borders of the house. We have mentioned that a damp atmosphere is indispensable in Fern-houses; but it is remarkable that many species of Ferns do not bear syringing, which injures the foliage, which becomes covered with spots, spoiling the fronds, and ultimately destroying them. In any case it is advisable, especially during the growing season, to moisten the trunks from time to time, especially those forming radical fibres. Thanks to these precautions, and to the care bestowed upon them, it is not rare in the Botanic Garden to see Fern fronds which have lasted two or even three years. We must close this note by expressing our thanks to the capable and talented Curator, M. L. Lubbers, to whom the plants under his care owe their healthy and well-arranged appearance.

NOTES ON BELGIAN HORTICULTURE.

When *Araucaria excelsa* is propagated in a green-

FIG. 12.—A, GALANTHUS IMPERATI; B, G. NIVALIS; C, G. LATIFOLIUS. (SEE P. 268.)

some of which measure more than 4 feet. Looking round, it is at once seen that these roots, which support the plant so well must seek nourishment, which appears to consist chiefly of manured sphagnum moss. A very effective group is composed of a sturdy specimen of *Monstera deliciosa*, bearing flowers and fruit. It is known that when fertilised, the spadix of *Monstera* gives out heat; the fruits have the scent of Melon or Pine, and are edible. The clump measures nearly 15 feet in diameter at the base, and is nearly 17 feet high. It is quite a labyrinth of leaves of diverse shapes, much cut and

by Ghiesbreght. The down which covers the base of the rachis is reddish-gold; in the sunlight it shines brightly, and gives the Fern a charming and distinguished appearance.

This down is used in surgery to stop bleeding from wounds. A neighbouring species, *Cibotium Schiedii*, has a small trunk, but is one of the most graceful, light, and elegant of species. A superb variety is *Alphophila elegans*. The magnificent crown of fronds, with more or less dentate and undulate pinnules of a shining green colour, forms an immense parasol. The trunk is well pro-

house, all know that thrips cause great havoc among the young plants, and that it is difficult, when one of these is attacked, to save those which are near it. In order to prevent the spread of the mischief which these insects do, and at the same time to ensure the cuttings striking, one of the principal nurserymen of Ghent places the cuttings under a bell-glass, so that each one is completely isolated. If thrips attack subjects found under a bell-glass with others, the evil can be localised. We have seen a house containing many thousands of bell-glasses sheltering cuttings which had struck. When the cuttings are taken into a house, it is necessary to admit air frequently, so as to avoid the ravages of thrips which develop rapidly in a close atmosphere. The use of hand-glasses prevents this inconvenience and saves much trouble.

In the same establishment we saw thousands of seeds of *Araucaria excelsa* and *Areca sapida* germinating very satisfactorily. This is perhaps the first time that seedlings of this species have been so successfully raised on the Continent.

I must draw the attention of those interested in the subject to the vast and remarkable glasshouses recently constructed at Ledeburg, near Ghent, and devoted to the culture of *Araucaria excelsa*.

In the same establishment there is now being built a shelter for the *Araucarias* in summer. This is formed by iron arches, the bases of which are about 15 feet apart, fixed on stones sunk in the earth. These arches are sustained on each side, and a third of the way up from the ground by oblique bars of iron, the bases of which define the limits of the centre path. All the arches are tied one to another at the upper part by long iron rods. This light and elegant building will be covered with little wooden lat blinds made of deal, and very cheap. This shelter will be about 500 feet long. Next season, when it is filled with *Araucarias*, it will be quite one of the horticultural curiosities of Ghent.

An important question to be considered by nurserymen who have to combat against the ravages of insects, is that of fumigating with tobacco-smoke. Many systems have been devised and recommended; all are inconvenient when the fumigator has to be lighted in the greenhouse. When this is done, usually the plants placed in the immediate vicinity of the recipient of the smoke suffer much. M. De Smet Frères remedy this inconvenience by placing the fumigating apparatus outside, and introducing the smoke through the lights by means of a pipe passing through an opening made in a square of zinc, which is inserted instead of one of the squares of glass. The opening usually remains closed. This is simple and practical, and overcomes a serious difficulty.

On the occasion of the Paris Exhibition, his Majesty King Leopold promoted one of our leading nurserymen, M. Alex. Dallière, to the rank of an officer of his Order. On the same occasion the French Government nominated the famous Orchid grower, M. A. A. Peeters, of Brussels, a Chevalier of the Legion of Honour.

Patriotism, so rooted in the Belgian people, has shown itself lately among our nurserymen in a different way from that in which it is usually displayed by the horticultural societies. In addition to the "Chambre Syndicale des Horticulteurs Belges," which played a prominent part in the important question of the Phylloxera Convention of Berne, we have had for some time in the capital, the "Chambre da Commerce Horticole Bruxellois." Some little time ago the nurserymen and gardeners of Antwerp held a meeting for the protection of their local interests. The number of nurserymen has considerably increased lately in the commercial metropolis of Belgium. M. Ch. van Geert, jun., was elected, by unanimous consent, President of the Antwerp Syndical Chamber.

Our horticultural literature has been enriched by a valuable little work, *Les Orchidées, leur structure, leur histoire, et leur culture*, by Lewis Castle. The

translation into French has been done by M. O. de Meuleneère, Secretary to the Belgian "Orchidophilistes." There is no doubt but that these useful pages will have with us as much success as attended their appearance in England.

The oldest iron house on the Continent—it has been built more than half a century—was constructed for M. Jean van Geert, and has for some time past been in great disrepair. At last it has been taken down. It was in the establishment of the son-in-law of the founder of the nursery in the outskirts of Brussels, at Ghent, M. Ed. Pynaert van Geert, who has replaced it by a magnificent glass-house of great size. Yet one more historical relic gone.

M. A. Gravis, Professor of Botany at the University of Liège, has just published in the *Annals of the Belgian Microscopical Society*, an interesting work on the anatomy and physiology of the conducting tissues in vascular plants. This paper forms a pamphlet of thirty pages, and has two lithographic plates. It is well worth the attention of botanists. *Ch. D. E.*

HOME CORRESPONDENCE.

THE HALL FOR HORTICULTURE.—That this can be anything but a trading concern in a sense is impossible, if it is to be expected to pay working expenses, and return the guarantors. Surely, there will be basements that can be let for storing and warehousing; offices where merchants and traders in horticultural things may have rooms; a restaurant, under the control—if not a license held, by the directors; permanent chambers for the various horticultural clubs, meetings, &c.; a central office always open, and under the joint control of the directors and the Royal Horticultural Society—a kind of Horticultural Mark Lane, in fact, where country people and brokers may meet; auction sales, such as Stevens' and Protheroe's be held; and from whence, in short, British horticulture will be in touch with all the horticultural world. Baron Schröder touched the right key when he ridiculed the idea of the Royal Horticultural Society being kennelled much longer in the Drill Hall. Meetings and shows that would interest all the world should be so centrally held that all the world can get at them, without going into such remote out-of-the-way places. What an inducement to the city man when he finds his business calls him into or near the Strand or Fleet Street, the proximity of the Hall for Horticulture and its fixed meetings, lectures, shows, auctions, and other organisations, would be! And what a splendid chance there would be of establishing an Horticultural Institute with its evening classes and lectures open to and within reach of every young gardener or student, whether from North, South, East, or West! There are two facts to keep sight of in fixing on the best site for the Hall. If on or near the Embankment, there will be scope for the laying out of grounds and for the more extensive ramification of the structure. If nearer to Covent Garden—say north side of the Strand, or adjoining the Law Courts (if ground can be had)—the commercial element would be much more benefited. Depend on it, it is well worth while attracting the commercial section of horticulture. It is strictly a commercial question, the supporting and promoting of the Hall for Horticulture. Not a merchant or trader in business but will look at it in that aspect. How will it benefit business? How will it cause more money to be spent over horticulture? That is the plain way of putting it. Commercially speaking, such an establishment for the interests of horticulture ought to be an assured success. Baron Schröder is too sound a man of business to forget that it is "money makes the mare to go;" and those gentlemen who are with the Baron—strictly men of business, will also make it their duty to feel their way commercially in the matter. Horticulture is a practical business, and if it can carry sentiment along with it, all the better for all parties interested. *R. Bate.*

ARDISIA CRENULATA.—Grown and berried as plants of this are at Orwell Park, Suffolk, nothing could be more useful, especially for table decorations, these being all aglow with colour, and show up in

most pleasing contrast with the white cloth and are accessories on it. The plants referred to are of heights ranging from 6 inches to 1½ foot. On inquiring of Mr. Wallis how he managed to have them so good, I was told that he raised them from seed—seeds being sown every year—and these are saved from the best fruited plants only, and doubtless this practice of selection has helped to improve the strain; but if he will tell the readers of the *Gardeners' Chronicle* more about them, and let the Editor see one of his plants, he will assist many who may have failed in growing and fruiting *Ardisia*. *J. Sheppard.*

LAMINGTON AND ITS LATE LORD.—I do not think I was ever more impressed with an example of well-directed human intelligence overcoming the several disadvantages presented by climate and a barren and sterile soil, than in visiting Lamington, in Lanarkshire, a few years ago. The history of the creation of this place, for it may be called so, related by the late lamented peer, and the story of its gradual regeneration, may not be without interest to owners and others connected with the work of reclaiming uncultivated land and the improvement of estates. Upwards of half a century since the late lord, then Mr. Baillie Cochrane, on succeeding to the Lanarkshire property, made his way with some difficulty to the village of Lamington. The trackways for roads, in the sense we understand them, hardly existed; he found a rude lodge, tenanted by the keeper, on the spot now occupied by the house; some scattered hovels formed the village; their occupants were a wild, half-savage community, whose curiosity was greatly excited as they gathered about the carriage, examining with wondering eyes the vehicle and its equipage, and marvelling as they passed their hands over the smooth panels, at its finished workmanship. The country around was a wide expanse of Heather-covered hill, unrelieved by trees; its rugged, bare, and desolate aspect was enough to discourage any but one of a very hopeful nature. The work of improvement was commenced, and year by year it advanced, not with great or extravagant expenditure, but by a judicious investment of capital devoted to drainage, the erection of cottages, and additions to the residence; and what seemed at first hopeless became more and more possible under the force of resolution, and bent to the work; with additions to the house, the garden boundary was amplified, bright lawns replaced the dark lurid heather; shrubs and flowers were introduced, and sheltering plantations of pine and Fir sprang up along the hill sides—but the village became the feature of the estate, once so forlorn and comfortless. Immediately adjoining the pleasure ground, it seemed a continuation of the house garden from its floral character: it was in itself a garden, each cottage a picture of neatness and comfort, covered with gay creepers, and with abundant ground around it carefully tended, and the people, well clad and healthy, looked removed by centuries from their rude forefathers of the proprietor's early experience. A village church and parsonage added to the ideal picture, and a chapel and manse gave all the people opportunities of worship according to conscience. If, as has been said, that the man who makes two blades of grass grow where only one grew before, is deserving well of his country, the man in whose power it lay, and whose benevolent energy was directed to an improvement that exemplified possibilities of a better state of things in a neglected district, who brightened the lives of hundreds, who brought wholesome literature to their doors, and gave examples of taste, and brought to their view the riches of horticulture, is surely deserving the respect and gratitude of posterity. *W. I.*

TREES AND SHRUBS SUITABLE FOR PLANTING ON CHALKY SOILS.—The following list of trees and shrubs will be found suitable for planting on chalky soil: *Berberis aquifolium*, *Buddleia globosa*, *Buxus in variety*, *Cerasus Laurocerasus caucasica*, *C. L. rotundifolia*, *Cornus in variety*, *Cornifolia Emerus*, *Cotoneaster Simonsii*, *Crataegus in variety*, *Daphne pontica*, *Fagus sylvatica*, *F. purpurea*, and all other varieties; *Hibiscus syriacus* and *Hylæpericum*, *Hollies*, *Lycycteria formosa*, *Privets*, *Philadelphus coronarius* and other varieties; *Pinus austriaca*, *P. nobilis*, *Populus in variety*, *Rhamnus*, *Bissardi*, *Pyrus aria*, *Ribes*, *Sambucus nigra*, *S. racemosa*, *S. variegata*, *Symphoricarpos racemosus*, *Taxus baccata*, *T. baccata aurea*, and other varieties; *Viburnum opulus flore pleno*, *Vincas*, and *Veronica Traversii*. The above mentioned varieties are planted here where the subsoil is pure chalk, and are all doing

well. Before planting, the ground was thoroughly trenched, and at the time of planting some peat-moss manure was mixed in with the soil. The varieties which make the strongest growths are the Buddleas, Leycesterias, Ligustrums, Ribes, Sambucus, and Veronica Traversii; small plants of the last named that were planted four years ago, now measure 4 feet through. *R. Edwards, The Gardens, Bechey Lees, Otford, Essex.*

EUCHARIS AMAZONICA.—The plant figured in your issue for February 15 last, shows a plant in a high state of cultivation. I would make mention of another which is deserving of notice. It is to be found at Smeaton, Haddingtonshire, Sir T. B. Hepburn's residence. This plant has, however, only thirty-three spikes, but it is fully 3 feet in diameter. It flowered during October last, but not so well as at present. *D. F.*

TRAINED SPECIMEN CHRYSANTHEMUMS.—The glorious "mum," that indispensable and justly popular flower that enlivens the close of the year, seems to arouse rancorous feelings in the breasts of some—they tell us that we are driving too much at "big uns," that the show boards will have to be made larger, and disqualifications have taken place during using blooms—well, perhaps distinct without a difference. Judges, who are, or have been, extensive exhibitors, and who are supposed to know all about

then in bloom. I took particular notice of them, as I thought they were much like *P. cortusoides* v. *amena*, but I found flowers of the latter were of a deep rose, whilst those of the former are of an intense purple. When the plants are in bloom I will forward you a few of the flowers. *C. H. Snook.*

PLANTING PERENNIALS.—I quite agree with "Mr. J. Paddock," see p. 759, vol. vi., that "borders" for perennials cannot in all cases be dispensed with, yet there are instances where these hardy perennials may be disposed to far greater advantage than now. And the one object I had in my note at p. 685 in dismissing the idea of the border altogether, was if possible to create a desire for change from the too frequent monotony of herbaceous borders, to the more effective grouping of them, and to bring them if possible within the limits of the flower garden proper. Why should not hardy perennials figure more conspicuously in a series of bold beds on the lawn than they do? Surely there is abundant material, decorative, free flowering, and valuable beyond doubt to admit of this being done; or why cannot a piece of ground in a good position where they are planted in those establishments where they are cared for, on an equal footing with the summer bedding arrangements or the rose? I know of some few places where this style of gardening has been carried out with excellent results, and it is always satisfying, and strangers who have never before seen its adoption invariably

SOCIETIES.

EDINBURGH BOTANICAL.

FEBRUARY 13.—The Society met this evening in 5, St. Andrew Square, Mr. Lindsay, President, in the chair. The following communications were read:—

1. "Notice of the Occurrence of *Arenaria gothica*, Fries, in Great Britain, with Exhibition of Specimen." By Arthur Bennett, F.L.S.
2. "Observations on the Glands and Secretions of *Galium Aparine*." With Microscopic Demonstration. By Thomas Berwick, St. Andrews. Communicated by Dr. Wilson.
3. "Note on the Formation of Adventitious Buds on the Leaf of *Gnetum guenoni*." By Professor F. O. Bower, M.A., D.Sc., F.L.S.
4. "Exhibition of Embryo-sacs of *Gnetum guenoni*." By Professor F. O. Bower, M.A., D.Sc., F.L.S.
5. "Exhibition of a Preparation of *Conium Solms*, showing the Archegonium of *Cycas*." By Professor F. O. Bower, M.A., D.Sc., F.L.S.
6. "Obituary Notice of Dr. Grierson, Thornhill." By J. Shaw Tynron. Communicated by Rev. W. M. McDonald.
7. "On Temperature and Vegetation at the Royal Botanic Garden." By R. Lindsay, Curator.
8. "On Temperature and Vegetation at the Botanic Institute, Glasgow." By R. Bullen, Curator.
9. Exhibition of Specimens:—
Fruit of a *Dipladenia* from Demerara, from P. Neill Fraser, Esq.
Flowers of *Brownea coccinea*, Seedlings of *Helleborus niger* and *H. orientalis*, having various coloured flowers.
Leucocium vernum, twin-flowered, &c., from the garden.

Report on the Open-air Vegetation in the Edinburgh Botanic Garden, January, 1890.—The past month has again been unusually mild. Vegetation is considerably in advance of what it was at the same date last year. Hardly spring flowers are not only earlier, but are more vigorous, and flowering more profusely than they have done for some years back. The various species and varieties of *Helleborus* have rarely been seen in such fine condition. Hazel, Alder, and Garrya are perfectly covered with flowers this season.

During the month the thermometer was at or below the freezing point on twelve mornings, indicating collectively 45° of frost, as against 57° for the corresponding month last year. The lowest readings occurred on the 3rd, 21, 23rd, 23rd, 24th, 23rd, 28th, 27, 29th, 26°. The lowest day temperature was 35° on the 23rd of the month; and the highest 57° on the 16th.

On the rock garden, thirty-seven species and varieties came into flower, amongst which were *Crocus annulatus* and *Imperati*, *Colchicum crociflorum*, *Galanthus Elwesii* and *Imperati*, *Cyclamen Atkinsii*, *Hepatica angulosa*, *Leucocium carpathicum*, *Primula denticulata*, *Hyacinthus azureus*, *Polygala Chamæbuxus*, *Ranunculus anemonoides*, *Saxifraga Bursariana*, &c.

Of the forty plants whose dates of flowering are annually recorded, the following eighteen came into flower during the month, viz., *Diondia Eppipactis*, on January 6, *Scilla præcox*, 6th; *S. sibirica*, 7th; *Galanthus nivalis*, 13th; *Branthis hycnalis*, 13th; *Corylus Avellana*, 13th; *Leucocium vernum*, 16th; *Galanthus plicatus*, 17th; *Rhododendron atrovirens*, 18th; *Tussilago alba*, 19th; *Rhododendron Noblesanum*, 20th; *Daphne Mezereum*, 21th; *Crocus susianus*, 25th; *Bulbocodium vernum*, 29th; *Crocus vernus*, 30th; *Tussilago nivea*, 30th; *Sisyrinchium grandiflorum*, 31st; *Symlococcus foetidus*, 31st. These are on an average three weeks earlier than last year.

Record of the Temperature and Vegetation in the Botanic Garden, Glasgow, January, 1890.—The mean temperature was unusually high for the month, and, with the exception of January, 1881, less frost was registered than on any January for many years. The lowest reading was 25° (9° of frost) on the night of the 22nd. Total frost, only 35°.

FIG. 13.—*Galanthus nivalis*, SHATOCK'S VARIETY, WITH SPATHE REPRESENTED BY TWO LEAVES. (REV. P. 265.)

"mums," are getting riled at, and your correspondent, Mr. Jenkins, p. 699, vol. vi., objected to both grower and judges of trained specimens at the Kingston show. I had not the opportunity of seeing these plants, but I have seen good ones there, those which Messrs. King, Beckett, &c., turned out some few years ago. Specimen Chrysanthemums form an attractive feature to many shows, and I am pleased to think the Kingston judges were more liberally inclined than Mr. Jenkins would seem to appreciate in awarding the first prize; probably next season there will be greater competition, which the withholding of prizes would not encourage. Magistrates are wont to tell dissatisfied litigants that the visit to administer the law as they find it, and not to make it. Judges at flower shows adjudicate on what is placed before them, and do not attempt to define what the exhibits ought or ought not to be. A specimen "mum," well handled, with flowers erect, like soldiers at drill, is a plant to be admired. It is not much trouble to the grower of such varieties as "Fair Maid of Guernsey" and "Peter the Great" to attain to that degree of excellence. If Mr. Jenkins can tell us how to make the blooms of heavy incurved varieties stand erect, and properly face the audience, without staking, he will oblige. *A South-eastern Flat Traminer.*

PRIMULA AMENA.—I saw Mr. Wolley Dod's note concerning this *Primula*, which I do not think is lost to English cultivators, for I believe my father has in his possession some six or eight plants of it. It is about three years ago since I saw them, and they were

seemed surprised at the results. In this, however, as in all else, we must adapt ourselves and our tastes to surrounding circumstances. At the same time, I plead that hardy herbaceous perennials are of sufficient importance in the majority to justify their use in the most select parts of the garden, instead of almost solely in the kitchen garden, as we are wont to see them. Borders must and will always exist of these plants undoubtedly, and I am pleased to see Mr. Paddock is so interested in these plants, also that his border is not one of those continuous straight ones, and the grouping carried out as described by your correspondent cannot fail to produce good results; it is infinitely more satisfactory than dotting with single plants throughout. If your correspondent would give the position of the border, which is described as 30 yards long and 10 yards wide, also the trees which shade it, I may be able to give him a selection of plants to suit his purpose, as he says he is "at a loss how to arrange the rest of the border," which seems to offer facilities for some effective grouping, unless the roots of the overhanging trees prevent this. At any rate, I shall have pleasure in rendering what assistance is in my power. *J.*

COLCHICUM PROCURRENS, Baker.—In reference to this new species, published in your last issue, it is but right to state that it was first introduced by Mr. T. S. Ware, of Hale Farm Nurseries, Tottenham, where I saw it in flower two years ago. It was received by that firm under the name of *Merendera sobolifera*, but at the time I saw it in flower it was simply labeled *Colchicum* sp. *D.*

THE WEATHER.

(By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° contained for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts.—1, Scotland, N.E.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Growing A.C. Districts.—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending February 22nd, is furnished from the Meteorological Office:—

"The weather has been dull or gloomy in nearly all parts of the Kingdom, with a good deal of mist or fog; very little rain has fallen over England, but in Ireland, Scotland, and the south-west of England, the falls, though slight, were somewhat frequent."

"The temperature has been a little above the mean in 'Scotland, N., Ireland, England, S.W., and the Channel Islands,' but in all other districts a deficit of 1° or 2° is shown. The highest of the maxima, which were recorded on very irregular dates, ranged from 56° in 'Ireland, S., to 47° in 'England, N.E.," and 49° in 'Scotland, W.' The lowest of the minima were registered in most instances on the 16th, and varied from 22° to 30° in Scotland, from 21° to 25° over Ireland, and from 27° to 50° over England. In the 'Channel Islands' the thermometer did not fall below 42°."

"The rainfall has just equalled the mean in 'Ireland, S., and slightly exceeded it in the 'Channel Islands'; in the other districts it has been less than the normal."

"Bright sunshine" shows a very decided decrease at nearly all stations, the percentage of the possible duration having ranged from 3 to 12 in Scotland, from 12 to 16 in Ireland, and from 10 to 26 over England."

Obituary.

MAURICE YOUNG.—It is with great pain that we have to record the death of Mr. Maurice Young, aged 56 years. He had been in ill-health for some time past, and his misfortunes, no doubt, prevented him from resisting the effects of disease, as he might otherwise have done. An attack of influenza followed by a relapse and inflammation of the lungs, caused his death on the 24th inst. For many years, like his father before him, he occupied a nursery at Milford, near Godalming, the father being a tenant of the celebrated botanist, Philip Barker Webb.

Maurice Young had a thorough knowledge of his business, and of landscape gardening and planting. He was interested in plants for their own sake, as well as from a business point of view, and we had frequent occasion to consult him, and avail ourselves of his experience and knowledge. He was a straightforward, honourable man, who was liked and respected by all who knew him, and one with whose misfortunes everyone sympathised. May the knowledge of these circumstances enable the widow and family the better to bear their bereavement.

WILLIAM HUMPHREYS.—We regret to record the death of William Humphreys, on the 22nd ult., at the age of sixty-eight years. The deceased, who was head gardener to the late and present Earls of Hardwicke, at Wimpole Hall, Cambridgeshire, had held the post for twenty-six years, and was greatly respected by his employers and neighbours. He was one of the most successful cultivators of choice fruits. The flower and kitchen gardens at Wimpole are models of admirable keeping and arrangement, and were formed under his superintendence.

E. MAGGS.—We also regret to announce the death of Mr. E. Maggs, gardener at the Manor House, Aylesbury, Bucks, which took place, from typhoid fever, on Sunday last. The deceased had held the post of head gardener at the Manor House for the past fourteen years. He took an active share in the management of the local floral and horticultural and Chrysanthemum societies, and was greatly respected. Much sympathy is felt for Mrs. Maggs, who has now lost within a brief period her husband and eldest daughter, both from typhoid fever, and has at the present time lying dangerously ill of the same malady an only son, she having lost her eldest son, some three or four years ago, from diphtheria.

MARKETS.

COVENT GARDEN, February 27.

No alteration. Business very quiet. James Webber, Wholesale Apple Market.

Last year's total frost for January was 51°. The year previous 48°. So that we are experiencing a succession of mild winters. After the first day or two of the month, the weather became very variable, and continued so throughout. Rainfall was both frequent and heavy, with just sufficient sleet at times to remind us of winter. On the 14th, 18th, and 25th, storms of considerable severity and duration were experienced, the last one exceeding in severity and velocity either of the others. Professor Grant reports that a pressure of 28 lb. to the square foot was registered at the Glasgow Observatory. These storms extended far beyond our shores, great damage being done. Vegetation is in a very advanced state, common Elder, Japan Quince, scarlet Ribes, &c., have young shoots from 1 to 3 inches in length.

BRITISH FRUIT GROWERS' ASSOCIATION.

A MEETING of the General Committee was held in the Horticultural Club room, Hotel Windsor, Victoria Street, S.W., on Wednesday, February 19, Mr. T. Francis Rivers in the chair. Thirteen members were elected, and some additions were made to the Executive Committee. The place of meeting for the Committee during the year next came under consideration; the Rev. H. D. O'Brien had been written to with the object of making some arrangements for holding the meetings at the Horticultural Club, and a reply was now read in which it was stated that "the Committee gladly accedes to the proposal," with regard to the Conferences of 1890, and it was resolved that the Association should hold the following meetings to deal with the subjects named:—Friday, June 27, Royal Aquarium, Westminster; Strawberries, and bush fruits; Tuesday, August 5, Leicester, general fruit culture for profit; Friday, September 5, Crystal Palace, Plums and stone fruits; Thursday, September 11, Brighton, general fruit culture, Grapes and Potatoes; Wednesday, October 15, Royal Aquarium, Apples. Orders of papers upon several subjects had already been received from members and friends of the Association, and the full programme will be announced later on.

It was resolved that the General and Executive Committee meetings be held in the Horticultural Club room at 5 p.m. on Thursdays, March 6, April 3, May 1, June 5, July 24, August 21, October 2, November 27, and December 18.

Communications were read from provincial societies with regard to providing lectures at their meetings, and the Secretary was directed to communicate with several experienced fruit growers on the subject.

Mr. T. W. Beach, Brentford, exhibited a lamp which he had employed for suspending amongst his fruit trees, to catch the winter moth and other pests. We have before had occasion to refer to this lamp, which, as has been pointed out, is of comparatively little use as a preventive against the winter moth, as the females of that insect are wingless.

Mr. T. F. Rivers referred to the loss the Association and the fruit interest had sustained by the death of Mr. Wildsmith, and it was resolved that a letter of condolence be sent to Mrs. Wildsmith.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: s. d. s. d. and s. d. s. d. listing prices for Asparagus, Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Leeks, Lettuces, Mushrooms, Mustard and Cress, Onions, Parsley, Rhubarb, Spinach, Spruce, Turnips, and new items.

POTATOS.—Supply of old Potatoes continue plentiful, and market has tendency to fall. Fresh arrival of Canary new potatoes: price from 16s. to 22s. cwt. Market quiet. Inferior samples difficult to sell except at lower figures. New Potatoes best samples quickly cleared at 20s. to 24s. cwt. J. B. Thomas.

SEEDS.

LONDON: Feb. 26.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report to-day's market thinly attended. Business in seeds still continues in narrow limits. However, when country buyers finally make up their minds to begin to operate, they will find prices all along the line temptingly low. There is no change in Red Clover Seed. Alsike, white and Trefoil keep firm. In Trefoil there is a hardening tendency. French and Perennial Rye-grasses continue exceedingly cheap. Some new English Spring Tares are now offering. More money is asked for Rape and Millet seeds. Blue Peas are steady.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter), during the week ending February 22:—Wheat, 25s. 9d.; Barley, 31s. 2d.; Oats, 18s. 6d. For the corresponding period in 1889:—Wheat, 25s. 5d.; Barley, 26s. 5d.; Oats, 16s. 8d.

FRUITS AND VEGETABLES.

SPITALFIELDS: Feb. 25.—Good supplies of fresh vegetables and fruit. Abundant supplies of Potatoes. Demand good for vegetables and fruit, but very slow for Potatoes. Prices:—English Apples, 5s. to 8s. per bushel; American do., 16s. to 21s. per barrel; Savoys, 1s. 6d. to 3s. 6d. per tally; Cauliflowers, 1s. to 3s. do.; Carley Kale, 4d. to 9d. per bushel; Seakale, 1s. to 1s. 6d. per punnet; Spinach, 6d. to 1s. per bushel; Brussels Sprouts, 9d. to 1s. per half-sieve; Turnip-tops, 1s. to 2s. per sack; Sprouting Broccoli, 1s. 6d. to 1s. 9d. do.; do., 5d. to 7d. per sieve; Greens, 1s. to 2s. 6d. per dozen bunches; Turnips, 2s. 6d. to 3s.; Carrots, 1s. 6d. to 2s. 6d. do.; do., 10s. to 24s. per ton; Parsley, 2s. to 3s. per dozen bunches; Parsnips, 4d. to 9d. per score; Beet-roots, 1d. to 6d. per dozen; Horse-radish, 1s. to 1s. 4d. per bundle; Celery, 4s. to 12s. per dozen bundles; Endive, 1s. 6d. to 2s. per dozen; Leeks, 1s. to 1s. 6d. do.; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; English Onions, 10s. to 11s. per bag; Spanish do., 10s. to 11s. 6d. per cask; Bordeaux do., 7s. to 8s. do.; Dutch and Belgian do., 7s. to 8s. per bag of 110 lb.

STRAFORD: Feb. 25.—Supply has been good during the past week, and a fair trade was done at the following prices:—Savoys, 3s. to 3s. per tally; Cauliflowers (Gienrassey), 2s. to 3s. per barrel; do. (Cornish), 5s. to 10s. per crate; Turnips, 25s. to 35s. per ton; Carrots (household), 35s. to 40s. do.; do. (cattle feeding), 20s. to 25s. do.; Parsnips, 19s. to 30s. do.; Mangels, 14s. to 18s. do.; Swedes, 15s. to 18s. do.; Onions, English, 10s. to 11s. 6d. per bag; do., Dutch, 6s. to 6d. do.; Apples, English, 5s. to 7s. per bushel; do., American, 18s. to 28s. per barrel; Celery, 3s. to 3s. per dozen rolls; Rhubarb, 1s. 9d. to 2s. per dozen bundles.

POTATOS.

BODROGH AND SPITALFIELDS: Feb. 25.—Quotations:—Regents, 40s. to 50s.; Hebrons, 40s. to 50s.; Magnums, black, 40s. to 50s.; Bedfordas, 40s. to 55s.; Lincolns, 45s. to 60s.; Yorks, 50s. to 70s.; Scotch, 50s. to 100s.; Imperators, 40s. to 70s. per ton.

SPITALFIELDS: Feb. 26.—Quotations:—Magnums, 35s. to 50s.; Regents, 50s. to 60s.; Champignons, 40s. to 50s.; Imperators, 40s. to 65s.; Hebrons, 40s. to 60s. per ton.

STRAFORD: Feb. 25.—Quotations:—Scotch Magnums, 50s. to 80s.; Regents, 58s. to 68s.; English

do., 50s. to 60s.; light English Magnums, 45s. to 65s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 78s. to 92s.; inferior, do., 48s. to 75s.; hay, best, 68s. to 87s.; inferior, do., 26s. to 50s.; and straw, 26s. to 48s. per load.

ENQUIRIES.

"He that questioneth much shall learn much."—Bacon.

STEAM HEATING OF GLASS-HOUSES.—Will any of our readers kindly inform "J. P. & Sons" of any garden where steam is used for the warming of glass-houses, and what its advantages are, if any? It was used and well thought of by the late Peter Henderson, of New York, but has not gained ground here.]

ZUCCH POTATOS.—Can anyone say what these are? J. C.

NOTICES TO CORRESPONDENTS.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

APPLES SPAN BAYARD: J. E. We should think you could grow these fruits anywhere in your locality if shelter can be procured, and especially on walls facing east and north. The south wall would be too warm for most English varieties, and the west aspect would suffer, probably from the heavy winds you will get from that quarter, and these being heavily salt-laden, cause much damage to blossoms and foliage. Dwarf Apples on the Paradise stock would give better results than pot trees under glass, especially if they are planted in properly prepared loamy soil, enclosed in parallelograms of 15 to 20 yards long and wide, sheltered by hedges of Whitethorn, Thunja sibirica, Wattleana, Maple, Hornbeam, Beech, or the like hedge-plants, to protect them from the wind. If trees must be grown under glass, it should be done in pots, and the glass shelter made use of only during the setting period, and till mild weather makes it safe to plunge the pots to half their depth out-of-doors. Apple trees grown always in a glass-house, have beautiful but usually flavourless mealy fruits, that ripen out of season. Very late ripening varieties may be brought into the house early in October if the weather be boisterous. Employ pots just large enough to accommodate the roots, drain them moderately, use heavy loamy soil without much admixture of manure; pot very firmly, and give top-dressings of manure if the trees bear heavily. Shift the trees annually, and pinch the shoots once only and that in July.

AMARYLLIS: F. A. W. A nice tint of crimson, but the flower in the matter of form is not to be compared with some strains now in the field.

BOOKS.—BAREA'S "AMARYLLIDES": C. W. D. Published by Bell & Son, York Street, Covent Garden.—F. J. C. There is no separate Flora of Palestine, but all are contained in Boissier's Flora Orientalis. There is, however, a book by Mrs. Zeller, called Wild Flowers of the Holy Land, containing about fifty-four coloured plates of a very coarse description, and unaccompanied by text. There are also Plants of the Holy Land, by H. T. Osborne, Philadelphia, 1861; and Flowers from the Holy Land, by R. Trays, London, 1851. We have not seen either of the latter.—Manual of the Conifers, J. Veitch & Sons, 544, King's Road, Chelsea, S.W.

BOTANICAL NAMES: H. C. C. Get Nicholson's Dictionary of Gardening, the Supplement, sold separately, we believe, will give you what you want. (Upcott, Gill & Co., 179, Strand, London.)

CLOVER: H. C. C. Cow grass has a less hairy

stem, narrower leaves, and a stronger, less branching root, and flowers later than the common Red Clover.

DARLINS: R. G. G. Pack the roots closely in boxes or flat hampers, with leaf-mould, placing them under stages, or anywhere in a house with a maximum day warmth of 70°. Keep the roots in a damp state only—not wet, in a fortnight the shoots will have grown to a length of 2 to 3 inches. These may be broken off—not cut—close to the root, and struck singly, or two or three in a pot, of sandy leaf-mould, on a bottom-heat of 75° to 80°, in a close frame or propagating-case. When rooted, pot off and keep in a warmth of 60° till April; afterwards a greenhouse temperature will be sufficient for them. Put out-of-doors at the beginning of May, and plant in June. Cut them down half way if they should get tall before being planted out.

DENDROBIUM WARDIANUM: T. C. The variety of Dendrobium Wardianum is a very pretty one, but not better than many others which have appeared among the numerous large importations of that plant. The box in which your specimens were enclosed was smashed in the post, and the flowers greatly bruised.

GRAFTING: H. C. C. Yes, there is a certain amount of reciprocal influence of stock on scion, and vice versa, but an influence more apparent in the habit and growth than in actual form. The notion that Blood Oranges are produced by grafting on Pomegranates is sheer nonsense.

LAWN TENNIS: Gladstone. Write for the particulars required to some journal devoted to sports.

NAME OF FRUIT: W. C. & S. The Apple is probably Derbyshire Crab.

NAMES OF PLANTS: J. H. 1, crested variety of Yucca serrulata; 2, Polygodium aureum; 3, Chamaecyparis humilis; C. H. Perkins, Muehlenbeckia complexa; F. J. C. 1, Andropogon distachyon; 2, specimen insufficient; 3, Celtis australis; 4, Ankyroptalum gypsophiloides; 5, Carthamus lucoanalis; 6, Frankenia pulverulenta; 7, Zizyphus spinosa-Christi (Christ's Thorn).—H. R. Colonyne laccida; J. Smith, Rhododendron dauricum.—Vebridge. So far as we can determine them from small specimens, they are as follows:—1, Cupressus Lawsoniana; 2, Juniperus sinensis; 3, a form of Cupressus Lawsoniana; 4, Thuja Sieboldi; 5, Tsuga canadensis; 6, Juniperus virginiana.

NETAGINE LEAVES DISEASED: G. M. Your tree is suffering from an attack of what is called the Silver-leaf disease, which also affects Plums, Laurels, &c., in the open air. There is no ascertained cause, or known remedy, although it is thought by some cultivators that dryness at the root during the autumn and winter is a cause. It is commonly met with in light and gravelly soils, and less so in heavy ones. Cut off the affected branches.

CATALOGUES RECEIVED.

LA BELLE SAUVAGE YARD, LUDGATE HILL, E.C. BACHELORS WALK, DUBLIN.—Discount for Cash.

**GREAT REDUCTION IN PRICE
OF
STANDEN'S
Established
Nearly 30 Years. MANURE**

The reduction has been effected through the introduction of increased and improved plant for manufacturing.

It is now generally acknowledged that this highly concentrated Manure exceeds all others in general fertilising properties and staying powers, thus rendering its money value at least double that of any other Manure.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell.

It is consequently particularly adaptable for Amateurs equally with Nurserymen.

Sold in Tins of increased sizes, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in Kegs (Free) at the following greatly reduced prices: 28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

SOLE MANUFACTURERS

CHUBB, ROUND & CO., West Ferry Road, Millwall, London, E.
Bankers—Smith, Payne, & Smiths.

To Nurserymen and Gardeners.
PEAT FOR SALE.—Good Brown Fibrous Peat, Black Fibrous ditto, Light Sandy ditto for 0-chads, Azaleas, Rhododendrons, Heaths, &c., or for general purposes. Also good yellow gravel for drives, concrete, gravel, screenings, yellow sand, &c.—For particulars apply to Mr. J. ASTRIDGE, Brackendale Lodge, Camberley, Surrey.

BEESON'S MANURE.—The Best and Cheapest Fertiliser for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins, 2s. 6d., 5s. 6d., and 10s. 6d. each, or 1 cwt. Bags, sealed 12s. By all Seedsmen, or apply direct to W. H. BEESON, Carbrook Bone Mills, Sheffield.

NATIVE GUANO.—BEST AND CHEAPEST MANURE for Garden use. NATIVE GUANO. Price £1 10d. per ton, in bags. Lots and 10 cwt., 4s. per ton. 1 cwt. sample bag sent, carriage paid, to any station in England on receipt of P.O. for 5s.

Extracts from Thirteenth Annual Collection of Reports:
NATIVE GUANO for POTATOES, VEGETABLES, FRUIT, &c.—C. F. ILLER, Reading, used it for Potatoes, and says:—"I found your Manure gave very satisfactory results."
C. J. WAITE, Gr. to Col. the Hon. W. F. Talbot, says:—"I can strongly recommend your Native Guano as a first rate Manure for potatoes or kitchen crops, also generally, in the 5 years during which I have freely used it. It has gained over 500 prizes."
NATIVE GUANO for ROSES, TOMATOES, &c.—W. G. BAILEY, Nurseries, Bexley, used it for Roses, Tomatoes, and Cucumbers, and says:—"I find it a good and cheap article."
A. F. BARROW, Royal Horticultural Society, says:—"Without doubt a very valuable Manure, and easy of application."

Orders to the NATIVE GUANO CO., Limited, 29, New Bridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials, &c., may be obtained. Agents wanted.

For Green and Black Fly, American Blight, Camellia Scale, Red spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.
15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sir, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1 oz. to a gallon of water at a temperature of 65°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far, as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand-washing or spray—I remain, dear Sir, your truly. (Signed) A. MACKENZIE," of Messrs. Methven & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888.—"GENTLEMEN—I have given your insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effectual in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons) 10s. 6d. and 20s. each; in quantities of a gallon and upwards, 6s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.**

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from **WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.**

BENTLEY'S INSECTICIDE.

Mr. G. WYTHE'S, *Nylon House*, writes:—"Bentley's Insecticide is a great saving in comparison to others. We use it largely, and it never fails to thoroughly eradicate all insect pests."
For particulars apply to **JOSEPH BENTLEY, Chemical Works, Barrow-in-Furness, HULL.**

COLE'S BLOOD AND BONE MANURES.

ANTHRACITE COAL

The Best and Cheapest Fuel for Greenhouse Boilers, Stoves, and Heating Apparatus.

HENDREFORGAN ANTHRACITE SMOKELESS COAL—The UNITED ANTHRACITE COLLIERIES (Limited) supply their Nut or Cobble Coal (the Nut being about the size of a Walnut, and the Cobbles about the size of a man's fist, delivered in truck-loads to any railway station. This coal is ABSOLUTELY SMOKELESS, and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than coke. Quotations can be had on application to the Company's Offices, 23, Lime Street, London, E.C.

Quotations for London delivery can be obtained for the Northern, Western, and South-Western districts, from Messrs. G. R. CARTER AND SON, Coal Exchange, E.C.; and for the South-Eastern district, from Messrs. W. DOWELL AND CO., Coal Merchants, Greenwich, S.E.

LADY BAKER in a Gentleman's Garden, AGE 18. R. MIDDLEY, Jowett Road, Cawthorne, near Evesby, Yorks.

To the Trade.

MANAGER, or HEAD SHOPMAN First-class experience in all branches of the Trade; well up in the London and Country Trade. Good at Travelling, London, and Foreign. Understands and Bookkeeper. Would go abroad. Highest references.—E. C. H., 4, Wellington Street, Strand, W.C.

SHOPMAN, or MANAGER, Branch Business, —Age 30, thorough experience in all Departments. Highest references and testimonials. Do-oughted soon. X. MOSS, 21, HENRI VINCENY, Southwark Street, London, S.E.

SHOPMAN (HEAD), or otherwise, town or country. Age 41, married, E. Roman, 84, Colford Road, K. Angleson.

SHOPMAN (CASSIADA), AGE 21: eight years' experience in good establishments. A Gardener's Cottage or other, H. Wellington Street, Strand, W.C.

TO FLORISTS, —Wanted a situation by a young man in a first class Shop or Nursery, thoroughly expert on Bouquets, Sprays, Wreaths, Crosses, Floral Designs, and all out Flower Arrangements. First class references.—X. L., 59, Camden Street Parade, Birmingham.

Seed Trade.

ASSISTANT, AGE 21; five years' experience. A. E., Gardener's Chronicle Office, 11, Wellington Street, Strand, W.C.

SHORTHAND, A young Man with a good knowledge of Pitman's System seeks a situation where he could turn it to account. Good, 30 wages in London. Has been in the Service for several years.—PHONO, Gardener's Chronicle Office, 11, Wellington Street, Strand, W.C.

FOLLOWING'S PILLS, —Easy Digestion, —These admirable PILLS cannot be too highly appreciated for the wholesome power they exert over all disorders of the stomach, liver, bowels, and kidneys. They instantaneously relieve and steadily work out a thorough cure, and in its course dispel headache, indigestion, flatulence, and depression of spirits. It is wonderful to watch the daily improvement of the complexion, as Holloway's Pills purify the blood, and restore brightness to the face which had lost both flesh and colour. These Pills combine every excellence desirable in a domestic remedy. The most certain and beneficial results flow from the occasional use of this regular medicine, when persons in health, or when following sedentary occupation, will find it an invaluable agent.

"STANDARD" SEEDS.

NEW BROCCOLI.

SHARPE'S MONARCH.

This fine Broccoli was raised by a Gentleman's gardener in the Midlands, and judging from the reception it has received in the Birmingham and other important markets, it will, no doubt, become the kind for market purposes, being thoroughly reliable, and producing large, pure white heads; commanding prices ranging up to 8s. per dozen. The flower is well protected by the foliage until ready to cut, when the leaves fall back and expose a magnificent head of from 12 to 15 inches diameter, very firm and clear, of great weight, and entirely free from mossy or discoloured portions. Its season is from the middle of March to the end of April, and we have no hesitation in recommending this as being one of the best Broccoli sent out for years.

Price, per Sealed Packet, 1s. 6d.

POST-FREE.

CHARLES SHARPE & CO., SLEAFORD, LINCOLNSHIRE.

Sale of NURSERY STOCK and GREENHOUSE PLANTS from Sample.

MESSRS. PROTHEROE and MORRIS do-are to announce that their NEXT SALE will take place as above, for which they will be GLAD TO RECEIVE NOTICE OF ENTRIES AS EARLY AS POSSIBLE.

Friday, March 21.

From Messrs. F. Smith & Co., St. Albans. CATTLEY IMPERIALIS and others. Specially fine Importation, enormous masses.

MESSRS. PROTHEROE and MORRIS are instructed to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, March 21, at half-past 12 o'clock, a specially grand importation from Rezel's old locality, the Atrato River, whence came the superlative varieties of years ago. The present consignment has been sent by one of our oldest collectors, Mr. Bartholomew, and the plants have arrived in superb order, with grand leaves and buds, and fine dormant jets. CATTLEY IMPERIALIS is absolutely one of the finest of the whole genus. In the lot now offered there are masses with 300 superb buds, and many well-developed handsome, model specimens, that give the appearance of splendid established plants. There is altogether a distinctiveness about the plants now offered which should induce orchid-lovers to speculate, as something new will certainly turn up among them, and we recommend buyers to carefully inspect the plants offered, as we believe many of the specimens are areas, or a type of that magnificent Cattleya. We have now imported Cattleyas for twenty years, but have seldom seen such pictures of plants as many now offered. We spent a large sum of money in getting the consignment of this the finest Cattleya in the section. It is absolutely a fact that the whole of the lot came from the same locality. (See last number of Reichsbachia.) On view morning of Sale, and Catalogues had.

Frog Hall Nursery, Enfield Road, Southgate.

With a short distance of New Barnet and Oakleigh Park Stations, G.N.R.

MESSRS. HARKNELL and JAMESON will SELL by AUCTION, on the Premises as above, on TUESDAY, March 18, 1890, at 1 for 2 o'clock, 1000 well-grown NAMED ROSES, in pots; 500 healthy WINDOW PLANTS, consisting of the best varieties for market purposes; 10,000 standard MANETTA SPOCKS, 100 Red and White CHERTAN TREES. Good plants of the very best sorts. May be viewed by applying to Mr. GRAY, upon the Premises, of whom Catalogues may be had. Catalogues also at the usual firms in the neighbourhood; and of the Auctioneers, Barnet, N.

To Nurserymen and Florists.

BUSINESSES FOR DISPOSAL in all parts. Choice position, Rent; Income by valuation. Freehold Nursery, Sixes, price £45, Midland Counties, opportunity, price £1000. Several others. Particulars sent on application to A. W. WARREN, Horticultural and Business Transfer Agent, 50, West Street, Brighton.

GIGANTIC ORCHIDS: NATURE
VERSUS CULTURE.

WE are told by the poet that bulk is not everything, or, in other words, that—

"To grow in size just like a tree
Doth not make things better be."

and yet there is, other things being equal, a certain charm about size after all. We all remember the enormous plant of Cattleya Skinneri which Mr. Sander imported from South America, of which the illustration is reproduced (fig. 11). Certainly it was to some extent a cultivated specimen, having been grown in a tree near the dwelling-house of a peon, or labourer, as I believe was stated at the time. Then long ago there was at Chiswick a phenomenal plant of the then new and highly valued Lelia superbiens, and again a plant of very large Phalaenopsis (was it not P. Schilleriana?), which the Royal Horticultural Society's collector, the great Robert Fortune, had bought for a dollar from some natives who brought it to him in the Philippines suspended on a pole between two of them in much the same way as the Grapes of Eschol were brought from the Promised Land to the leader of the Israelites, when near the close of their wanderings. Every traveller—at least, every plant collector—must now and then in the course of his wanderings have come across remarkable specimens of the plants in which he was particularly interested; and often, even if not pretty generally, it will be found that man has had at least some influence so far as their ultra-extraordinary dimensions are concerned. This was in the case of Mr. Sander's great Cattleya Skinneri, and it was so in the case of Mr. A. Keyser's big plant of the Grammatophyllum (? speciosum), which he found in the collar of a great Durian tree; and I should suspect that the great Lelia and the remarkable Phalaenopsis above alluded to had also grown on isolated trees or in open sunny positions.

When I was wandering about the main island

FOR PLEASURE AND PROFIT.

FRUIT. Nothing so profitable and easy to grow, 74 Acres in stock.
See CATALOGUE for simple Instructions and kinds of Trees to suit all soils.

ROSES. 20 Acres. Bushes 8s. per dozen, 60s. per 100. 1/2" Packing and Carriage Free for Cash with Order.

THE MOST WONDERFUL CROPPING POTATO IN THE WORLD.

Price 2s. 6d. per peck, 8s. per bush., 21s. per sack.
Much cheaper by the ton.
Orders 2/6 and upwards carriage paid.

EVIDENCE OF SUPERIOR QUALITY AND PRODUCTIVENESS
From Hundreds of Unconcealed Testimonials received by us select the following

From Mr. H. HAMBLING, Woodchurch, August 12.
"I have had the honour of winning the SILVER CUP offered at our Show for the best collection of Potatoes. I sowed 123 varieties, 68 of which I had done from you. I grew 147 varieties, and the best cropper by far was THE DANIELS."
Quantity Plant'd, 11 lb. Quantity Raised, 725 lb.
From the "KEELING GUARDIAN," September 14.

"REMARKABLE POTATO YIELDS.—Mr. G. Johnson, of Woodcroft, has a crop of Potatoes remarkable both for size and quantity. He purchased 14 lb. of THE DANIELS seed from Messrs. Daniels Bros., Seed Growers, Norwich, and the 14 lb. of seed realised no less than 72s. 10s."

Before ordering, send for Daniels' New Potato Catalogue, containing Coloured and other Illustrations, and much valuable information. Gratis and post free to all.

DANIELS BROS., THE ROYAL SEEDSMEN, NORWICH.

of the Sooloo Archipelago, about mid-way between Borneo and the Philippines, a few years ago, I was very much impressed by the enormous specimens of *Grammatophyllum speciosum* which there also grow in the collars of the Durian trees. The fruit of the Durian is so highly valued by the Malays and their neighbours, the Chinese settlers, that, on no account, are the trees cut down when the forests are being cleared for cultivation. It is quite common to come upon isolated Durian trees, enormous specimens, or groups of smaller ones, with here and there little groves of Mango, or Mangosteen, Langsat, or Tarippe (a form of Jack-fruit), and other edible fruit-bearing trees miles and miles away from the little farmhouses or villages. The unsophisticated traveller has now and then concluded that these trees, being far away from habitations, had no owners; but if he should gather the fruit, or otherwise injure or molest them, he will soon hear to the contrary, and be obliged to redress the injury done, which is, as a rule, an easy matter to do.

In Borneo one is continually coming upon fruit trees, either singly or in groups, in the forest clearings, and also on or near the sites of old deserted villages, for it is a rule that, on the death of a headman, or chief, the old residences are deserted, and new ones made on another site. For sanitary reasons this is a very good practical rule; but although the old atap-houses, or Palm-thatched, pile-dwellings are often burned to the ground, the fruit trees still remain and continue the property of their former owners or their successors. Then new orchards spring up around the new village, which in its turn is again deserted, and so on, and now and then I have seen very fine plants of *Phalenopsis grandiflora*, *Grammatophyllum*, and *Platyceerium grande*, growing in the collars of these fruit trees.

As a rule, it is on isolated trees only that the ordinary traveller has a chance of observing Orchids, for in the dense forest-primeval everything is high up in the leafy roof over his head, and hidden to all but the boldest of native climbers by a multitude of leaves of all and every kind. Even with a good field-glass, or binocular, but little can be seen on account of the dense shade. Now and then, however, a fallen giant of the forest reveals somewhat of the epiphytal plant-life that is really there. Above you in the tropic forest is a world of light, air, and sunshine, which beasts, and birds, and insects (and snakes!), and beautiful flowers alike enjoy. Thus "high up overhead" the most lovely of Orchids hold their regal court in the sunshine, and are really "at home" to their numerous and especially invited winged guests. But now and then the fall of an enormous tree sapped to the core by huge parasitic fungus it may be, or caught by a tornado, lets light into the forest dimness below, and on or among its ruins lie revealed the beautiful burden it has supported for years. At p. 55 of my *Gardens of the Sun*, is the following passage which I quote here, *apropos* of Mr. Keyser's discovery. The words were pencilled down as I stood before the prostrate trunk and riven branches of a mighty species of *Dryobalanops*, or 'Camphor Tree,' which we had heard fall the night before when more than half-a-dozen miles away. "Here, right in the collar of the tree, is a plant of the *Grammatophyllum* Orchid, big enough to fill a Pickford's van, and just opening its golden-brown spotted flowers, on stout spikes 2 yards long. There, on the topmost branch, is a mass of the Moth Orchid, or *Phalenopsis*, bearing a hundred snowy flowers at least; and

in such healthy vigour is it, that lovers of Orchids at home—supposing it could be flashed direct to 'Stevens' in its present state—would outbid each other for such a glorious prize, until the hammer would fall at a price near on a hundred guineas, as it has done before for exceptional specimens of these lovely flowers. There, gleaming in the sunlight, like a scarlet jewel, beneath those great leathery aroid leaves, is a cluster of tubular *Eschynanthus* flowers; and here is another we Orchid—a tink pink-blossomed *Cirrhopetalum*, whose flowers and leaves scarcely rise above the bright carpet of velvety moss among which it grows. But what is that attractive gleam of gold and green swaying to and fro in the sunshine? Ah! that is a beauty of another kind! And a native to whom it is pointed out ejaculates, 'Chalaka! ular Tuan!'—a wicked snake, sir; and we are content to move on, and leave him alone in his glory. We tramp on for an hour longer without even the glimpse of a flower being visible, except here and there a few fragments on the ground, the remnant spolia of the flower world which exists on the roof of this grand cathedral of trees."

There are three or four species of *Grammatophyllum* known from Malacca and the Malay Archipelago, the most usually met with being *G. speciosum*, a plant rarely met with in British hothouses, because, as Mr. Williams says in his *Orchid Grower's Manual*, it requires "considerable space to grow it to perfection." The plant has been figured many times thus in *Bot. Mag.*, t. 5157; *Flore des Serres*, t. 1356; *Bateman's Second Century of Orchids*, t. 181; and also by Paxton, Lemaire, Blume, and Rumphius; as also in *Gard. Chron.*, n.s., vol. x., p. 181, *com aylog*, 2, here reproduced (fig. 16).

It is probable, from the dimensions given by Mr. H. Keyser, that his plant is *G. speciosum*, which, so far as I know, is the Anak of its race; but he has only to send a spray of its flowers and a stem to Mr. H. N. Ridley, the Director of the neighbouring Singapore Botanic Garden, to have all his doubts removed as to its specific identity.

The giant Orchids are not at present popular as a class, and it is not every one who, like our friend, Mr. Sander, can build special houses for a solitary specimen, as we were told he did, in anticipation of the arrival of his great *Catleya Skinneri*; but the day may come when these gigantic species may be valued, and someone may build for them the biggest and warmest of glass houses, so as to enjoy them as one sees them abroad, growing on or in the collars of Orange, Mango, Jack, Tarippe, Mangosteen, and other fruit trees, with groves of the golden clusters of Bananas hanging here and there, and Bamboo and Palms luxuriating near them in something like tropical luxuriance. No doubt the tropic fruit trees, and the giant Orchids have been neglected in our gardens; but, given capital and intelligent arrangements, and cultural attention, and there is no reason why we should not obtain a taste of both, even under the murky skies of our northern climate. Before I conclude this paper, I should like to add a word in reference to a remark recently made in these columns, *viz.*, that plants do not always grow naturally in the places best fitted for them. This axiom, as propounded by Herbert fifty years ago, and repeated but the other day is partially true; but the great essential fact remains that Nature, that is to say, wild plants of all kinds, as seen at their best, are far ahead of the same plants as cultivated in our gardens here at home. But there is another phase of culture, *viz.*, culture in the native habitats of the plants themselves, and here it is possible to improve on Nature even at

her best and highest level. Of course, I am now merely speaking of best from the cultivator's point of view, and not from the much wider biological standpoint.

Then there can be no question of some plants thriving better in other open air climates than their own. In Jamaica, for example, the Mango has naturalised itself, and bears fruits, I am told, superior to those wild in India or the Malay Archipelago. There also *Phaius grandifolius* of China has naturalised itself, even if it does not thrive better there than in its native Hong Kong.

The behaviour of the Scotch Thistle and the rabbit as introductions to Australia may also be cited, as also those cultivated weeds which follow the white man wherever he goes. A plant or an animal in its native country is often (but not always) surrounded by natural checks to its luxuriance or to its fertility, and culture consists, to a great extent, in the suppression of these natural checks to vegetative life and vigour. *F. W. Burbidge.*

NEW OR NOTEWORTHY PLANTS.

FRITILLARIA (AMBLIRION) CANALICULATA.*

This new *Fritillaria* most resembles *F. pyrenaica* in habit and general appearance, but it belongs to the small section of the genus in which the styles are connate up to the very apex. From *F. tulipifolia* and the other *Amblirions* it differs by its campanulate perianth. It was found by Siotenis in Kurdistan at Senûr, and a specimen has just been sent to me in a living state by Herr Max Leichtlin, with whom it has flowered for the first time at Baden-Baden this present February.

Bulb depresso-globose, nearly 2 in. diameter. Stem about a foot long, bearing ten to twelve alternate linear deeply channelled ascending glaucous leaves, the longest 3 to 4 in. long. Flowers 3—5, on short, drooping pedicels, bracteated at the base by six to eight crowded reduced leaves. Perianth campanulate, an inch long, outside glaucous vinose-purple, without any trace of tessellations; inside greenish-yellow; segments oblong, $\frac{3}{4}$ in. broad, falcate only in the upper third when expanded, bearing a small green oblong nectary, just above the base. Stamens $\frac{3}{4}$ in. long; filaments lanceolate, as long as the yellow linear anthers. Ovary green, cylindrical, $\frac{1}{2}$ in. long; style as long, forming a triangular column, connate up to the top. *J. G. Baker.*

XYLOSTEM COLLEYI, Rolfe.

Maxillaria Colleyi (Batem. ex Lindl., *Bot. Rep.*, xxiv., *Misc.*, p. 87) was described as long ago as 1838 from an imperfect specimen of unknown origin. The raceme, with an excellent water-colour sketch of a single flower, has laid in Dr. Lindley's herbarium ever since, but I cannot find that any more information about it has come to hand. Reichenbach knew nothing of it in 1861, when writing his account of the genus in the sixth volume of *Walpers' Annalen*. A fine plant of an *Orchid*, received from the Trinidad Botanic Garden last year, has just flowered at Kew, and proves to be the long-lost species. Whether it is a native of Trinidad, or a plant received by them from another source, we do not at present know, but its re-appearance is certainly interesting. The flowers are of a peculiar light reddish-brown, with numerous purple-brown spots, the lip of a shining

* *Fritillaria (Amblirion) canaliculata*, Baker, n. sp.—Bulb depresso-globose magno; caule subpedali foliis 10—12 alternis linearibus glaucis profunde canalicatis, floribus c. 3—5 coracis, pedicellis brevibus basi foliis pluribus reductis bracteatis, periantho campanulato pollicari extus sordide vinose-purpureo hinc tessellato intus flavo-viridi, segmentis oblongis supra medium suum connatis, nectario parvo oblongo supra-basi, staminibus perianthio paulo brevioribus, stylis ad apicem coactis.

FIG. 44.—GIGANTIC SPECIMEN OF *CATLEYA SKINNERI*. (SEE P. 287.)

blackish-purple, paler on margin. The smell is peculiar. Liddle compares it to that of an over-ripe Melon; to me it seems exactly like Cucumber, or the green shoots of Philadelphia. Root-me short, three to four flowered, like the broad bracts, dark purple-brown in colour. Leaves (not before described) broadly lanceolate, petiole, coriaceous, with three strong nerves, 12 to 15 inches long, 3 to 4 inches broad. Pseudobulbs oval, $1\frac{1}{2}$ inch long. It belongs to *Xylobium* (then considered a section of *Maxillaria*) and is very distinct from every other species of the genus. *R. A. Rolfe*.

A GARDENERS' PROBLEM.

As we are in committee on "a garden problem," it is permissible to speak more than once. I should like to draw attention to one point which has not been mentioned, but which seems to me of importance in the discussion. Some of your correspondents say that a knowledge of the native soil and surroundings of plants is of little or no use to them in the garden cultivation of the plants, and that they often succeed in growing them in soils in which they do not grow naturally. But gardeners must not assume that plants will not, or do not, naturally grow in any particular soil or situation merely because they have not been found in that particular soil or situation. Some plants do absolutely refuse to grow except in certain soils, such as the Rhododendrons and some of our chalk Orchids; but many, and probably the majority of plants, will grow in any soil, but in some soils the battle of life is more favourable to one set of plants, in other soils the battle goes in favour of another set of plants. I will illustrate my meaning by two familiar instances. I mentioned in my former letter the case of *Erica vagans*, which is not found in England off the serpentine, but grows freely in any garden. This at once shows that the serpentine is not necessary for the growth of the plant, and need not be imported with it, but it also shows that the serpentine is fatal to many other plants which elsewhere grow luxuriantly in Cornwall. Now when these plants reach the serpentine the *Erica vagans* is able to fight them at a great advantage, but when the *Erica vagans* comes into their county they are strong enough to fight it and strangle it, because they there have food that suits them, and so are lusty and strong. I have no doubt it is the same with many alpins. They are found to grow naturally on bare rocks and moraines; but it does not follow from that that they will only grow on such places. It shows that they will grow where other plants would starve, but they would also grow in more genial places, and in richer soils. Their seeds must often fall on the alpine meadows and pastures, and there they may germinate; but they meet there with a luxuriant growth of other plants, which soon suffocate them. When the Heath or the alpins are brought into gardens they have a fair field given them, and no favour shown to their adversaries, and so they grow, often in a soil very different to that in which they are found wild, but not in soil that is unnatural to them.

But the case may be carried much further. The discovery of a plant in a particular soil or situation does not prove that that is naturally the best for it; it may, and often must have been, squeezed out of better quarters, and now at last has found a place where it can carry on a starved existence. If it could have established itself in a better place, it might have been a very different plant. We have an instance of this ready to hand. All over the upper parts of the Cotswolds the *Campanula glomerata* grows as a dwarf plant, almost in its growth suggestive of *Gentiana acaulis*. But if it is brought into the garden it grows 3 or 4 feet high, and becomes a rampant troublesome weed. Does not this show that the larger and more luxuriant growth is its natural habit, but that it cannot fight the battle of life in the lowland pastures, and so has had to retreat to the upper regions, where it leads a starved and stunted life.

The gardener is able often to give his plants

advantages which they do not have in their native quarters, and so he is often able apparently to ignore their natural requirements. But it is only apparently; the real fact is that the knowledge he had acquired of the plants from books or travellers was only a limited knowledge—there was a great deal more history, which books or travellers could not tell him, and which his experiments have partially helped him to learn. But even when he succeeded in growing the plant, he has not learned its full history; he has learned something of its modern, but very little of its ancient history. *Henry N. Elliott*.

— As Mr. Woodall has mentioned my name seven times in his letter, I hope it will not be deemed egotistical if I say a few words in reply. With regard to *Polygala Chamebuxus*, I am not much surprised at what he says, for oddly enough, when I saw my own words in print in your columns it struck me for the first time that perhaps *Polygala Chamebuxus* might grow at a lower altitude than I had imagined, and that possibly leaf-mould might not be such a luxury to it after all. I know very well the sort of spot to which Mr. Woodall refers, and I can fancy how my little favourite would revel in it at once. What put me off the scent was this: neither Fröbel, nor Robinson, nor Gusman, nor Backhouse, in any list, nor catalogue, nor book that I have seen, gives leaf-mould as the right thing for this plant, and as I know Fröbel generally speaks from a close personal acquaintance with the mountains and their treasures, I thought it was growing higher up on their flanks than seems to be the case, and beyond the range of trees altogether. But I did not think much about it either one way or the other, nor does it seem to me to be of much moment in this discussion, excepting so far as the following consideration goes. It now is a most conspicuous instance of the value of empirical efforts. When all the books were wrong, and all the observers had failed to notice a point of very great importance, experiment put me on the exactly right course with regard to *Polygala Chamebuxus*, and it finds itself in its beloved leaf-mould after all! Could anything be more to the point? Much the same sort of thing could be said about other instances that have been given, but it is hardly necessary to dwell on them. What is important is, to clear the whole controversy from misconceptions and cross-purposes which have entered into it. When Mr. Woodall writes, "the thing we want is perfect knowledge, then we shall not attempt under circumstances where we must court failure; but more than half the battle is knowledge of the climate, soil, and temperature of your garden," he blesses me altogether, though I really thought till I came to those words that he was driving at something else. But when my good friend, Mr. Rose, says, "Nor can I see how empiricism can successfully compete against practice with science," I open my eyes, for nobody has said that for a moment. It is exactly the same thing as asserting that science is bad, and that a knowledge of the laws of Nature will only do harm. I never met with anyone who promulgated such an idea, nor have I ever come across the competition to which he alludes. Ever since I was a boy at school, and had to learn the familiar hackneyed line, "*Natura non expulsa furci*," &c. I have been under the impression that if you try to oppose Nature—either in your garden or anywhere else—you will be surely punished for the offence.

Then what is all this discussion about? I can fancy someone saying—We all mean the same thing, though it is differently expressed. My answer is, that we do not at all mean the same thing, and that there is in all this tangle of words one point of real value which must not be lost sight of. That important consideration is this, as it seems to me: Is Nature better consulted by a hard servile imitation of its conditions which seem all right, it may be to the eye, or is it more closely reproduced very often by what at first sight appears to run against it, but which really does not offend it

in the least? An example will explain what I mean. My greatly lamented friend, the late Sir George Hutt, often told me that *Rosa berberidifolia* was not properly grown in this garden—he used to say—"it can stand any amount of cold. I have seen it myself in Persia all frozen over. Why in the world do you put that large glass construction over its head? You should let it have liberty, it will stand many degrees of cold." But was he right for a moment in giving me such advice as that about the Rose? I had the benefit of Max Leichtlin's experience at Baden Baden before my eyes about this very plant, and I knew that when the frost came, away went *Rosa berberidifolia* with him altogether; so I kept my own counsel, and I have also kept the Rose, though I have no doubt that Sir George Hutt's reminiscences were perfectly correct, and that from a superficial point of view they could not be impeached at all. What I submit, therefore, as probably being the case is this: *Rosa berberidifolia* can stand a certain amount of cold, but only in proportion to the humidity of the surrounding atmosphere, and consequently there must be a vast difference between its habits in Persia and the Isle of Wight, and this must be taken into consideration if you want to succeed with it. You are treating it just as naturally if you more or less give it protection here, as you would be treating it unnaturally if you were to build a large greenhouse for it on the mountains of Afghanistan. And the same sort of thing goes on in ten thousand instances. Extreme literality is not of necessity scientific. It may be the very negation of science and what, off-hand, you may claim as consulting, for it may really give it its death-blow. And here it is, I submit, that the great value of observation and experiment come in. I have never had an idea that you can succeed in growing plants by suppressing Nature or running against Nature, or anything of the sort. It would be about as wise to try and teach a fish to walk on dry land. But I do think that we must not hastily assume that this or that is natural. Put it all to the test, allow for the differences of conditions in different places, and when you have got the "perfect knowledge" of which Mr. Woodall speaks, then, and then only can you afford to be certain that you are acting for the best. No less a person than Lord Bacon has said, the bold and enterprising are likely to meet with a greater number of tangible failures than the over-cautious; and yet, if you take a hundred average men of each description, you will find that the bold have had, on the whole, a more successful career;" and if that be translated into the language of horticulture, it is this:—Never mind the tangible failures which experimenting is certain to bring about. You will find out in that way what is really natural better than in any other way, and let this be your reward. *H. Ewbank*.

— "Granted that everything is known as to the physical conditions under which a plant grows in the Tropics, is the gardener who attempts to grow it really much better off?" Such is one question put by Mr. Dyer, whilst commenting upon the little advantage a gardener derives from a knowledge of the geographical distribution of plants. In answer to this I should say, that he certainly would have a decided advantage over one who was ignorant of such facts. First of all, because knowing the correct physical conditions of the locality whence the plant was obtained, he has some basis to work upon; whereas otherwise he would have to work upon whatever he thought best, perhaps from the texture of the leaves, or some other peculiarity.

The case of *Trichinium Manglietii*, which Mr. Dyer mentions, seems at first sight rather an exception to the above remarks, growing as it does in Nature in almost pure sand in most arid sun-burnt situations, and consequently most gardeners having that plant, if new to them, and knowing the physical conditions under which it grew in Nature, would endeavour to imitate her by potting it in sand, where it is found the plant fails; but by experiment it is found the plant enjoys under cultivation a good soil,

rich in cow-manure, and I have seen them do well under such treatment at Kew in the Cape-house. But, with a little foresight, one might see that Nature does not limit the plant to a 60 or 43-pot of pure and simple sand, for in all probability these plants receive equally as much moisture and nourishment from the sandy plains of South Africa, conveyed to the surface from perhaps some considerable depth by capillary attraction, as the cultivated ones do from the cow-manure.

Then, again, Mr. Dyer says, that "Nature is at best a very poor gardener." I entirely fail to see where she is. I have never come across a sickly plant in Nature; she never places a plant in any locality where it is not likely to grow up and bear fruit a hundredfold. Whereas there are many plants which good gardeners are unable to fruit in this country, excepting with a very great deal of trouble. Again, what gardener could produce such effects as Nature does in a tropical forest, or in a hedgerow or vale in Devonshire? Not one! Then assuming Nature is a poor gardener, why should our best landscape gardeners try to imitate the works of a poor gardener? What I contend is this, that in Nature plants grow as it is intended they should grow, and any plant artificially grown under glass or otherwise is simply what you might term a pleasing monstrosity." Take, for example, the enormous blooms of *Chrysanthemum* now produced under cultivation. *A. E. Greenbridge, Bayswater*. [In the absence of any new evidence on either side, we think it desirable that this interesting discussion should now be brought to a close. Ed.]

PLANT NOTES.

BRODIAEA LEICHTLINI.

FIRST described in the pages of the *Gardeners' Chronicle*, Feb. 20, 1875, p. 231, as *Milla Leichtlinii*, is a native of the Southern Andes. It was introduced by the gentleman whose name it bears, who presented bulbs to the Royal Gardens, Kew, where they are now flowering, and have been since the new year. It is a very distinct and well-marked species, nearest to *porrifolia* and *hullera*, but distinguished from these by its broader dark green, not glaucous leaves, single flowers, and very short peduncles. The flowers, over an inch in diameter, are pure white, with a conspicuous green keel down the back; slightly fragrant, and remaining for a considerable time fresh. It seems very slow of increase, and never, so far as we know, ripens its seed. It has been grown in the open border for many years, is quite hardy, and will be a desirable acquisition on account of its early flowering habit.

BRODIAEA PORRIFOLIA.

The old genus *Triteleia* first merged in that of *Milla*, and finally in the *Genoa Plantarum*, into *Brodiaea*, included a large number of *Chilium*, and other species, which, in the new order of things, have been broken up into numerous sections. The section *Triteleia* includes *uniflora*, *iscidites*, *laxa*, *peduncularis*, *crocea*, and many other well-known species; while *Hesperocordium*, in which the species have capanulate tubes, and the stamens distinctly inserted in two series, in addition to *B. porrifolia*, includes *subbilifera*, *aurea*, *hyacinthina*, *hirtella*, &c. Most of the species in this section are *Chilium*, as in the case of the above plant, and *subbilifera*, and they are hardy enough to stand untouched even in severe winters. *B. porrifolia* (*Milla*, Baker), (*Triteleia*, Popp. Frag. 10, *Knuth Ensaeratio*, iv., 408; C. Gay, *Fl. Chili*, vi., 118), and *Gard. Chron.*, in 1868, with a very poor figure, p. 990. It is a native of Chili, growing in grassy places; and was first discovered at Concau by Pöppig. It was also collected on the Cordilleras of Santiago by Phillipi, and first introduced by the indefatigable Herr M. Leichtlin, of Baden-Baden. It has proved to be quite as hardy as *B. (Triteleia) uniflora*, and though the flowers are not so numerous, they are quite as handsome, and

are produced in fairly large umbels. The flowers are described by Pöppig as being of a violet colour, but under cultivation they are white, with a more or less greenish rib along the centre of each segment. The flowers are inodorous, a great advantage certainly, as the Onion-like scent in *B. uniflora* is against its ever coming into use as a cut flower. It blooms at the same time as *B. uniflora*, and proves a most useful addition in spring when grown in sheltered spots. It forces very well, and may be obtained in full flower at the end of January. The long, narrow, glaucous leaves and straw-coloured spathes are very characteristic of the plant. *B. subbilifera*, *B. hyacinthina*, and *B. aurea* are equally useful, and quite worthy of general cultivation. *D. Denon*.

CASILLEJA INDIVISA.

The species of this extremely handsome genus are said to be parasitic, in the same sense as the *Orobanche*, *Pedicularis*, *Lathraea*, &c., but the above species is, at least, an exception to this rule. It would not be easy to imagine finer or better coloured specimens than those we have seen growing in the ordinary soil of a common flower border, far from the reach of roots by which it could possibly be benefited. At Kew, in the rock garden, and also in the poor sandy soil of the herbaceous ground, the plant was last year very attractive, and towards autumn it was so brilliantly coloured as to be remarked by every one who saw it. Unfortunately the plant requires such careful rearing as to be out of the reach of those who may not possess a frame or pit; for, though the seeds will germinate in the open, they are usually so late in coming as to leave scarcely sufficient time to mature before autumn has arrived. The plant seems to be perennial, but it does admirably when treated as an annual—that is, sown in heat early in spring, transplanted into boxes when large enough to handle, and keeping the seedlings to a light airy position near the glass, and out of the reach of cold draughts. What has to be guarded against is, the tendency the plants have to throw up flower-stems prematurely, which are, of course, weak, and the plants producing them not worth planting out; but if treated in the manner described above, there will be little fear of this occurring. Towards the end of the month of May they should be planted out in the open, in soil that is good but light, and in as warm a position as may be available. The flowers are inconspicuous, but the bracts which in strong plants are very large and of the most brilliant crimson-scarlet, last in perfection for a considerable period of time. Seeds ripen in the open border, and, if carefully stored, are available for future sowings. *D.*

MEDINILLA CURSIVA.

This plant was figured in the *Gardeners' Chronicle*, vol. xx., p. 621, also in *Bot. Mag.*, 66-1; but beyond this, very little, if anything, has been heard of it. In habit it is rather unlike the other cultivated members of the genus, and a good point in its favour is that it is nearly always in flower. It grows freely, and is easily propagated from cuttings; and the habit of growth suggests that it would make a good pillar plant, or would lend itself well to exhibition. It requires the temperature of a stove like other *Medinilla*s, and thrives in a compost of turfy loam and peat, with a good addition of silver-sand. It is useful for cutting from, as it may be cut from without fear of injuring it. It was discovered on the Western Coast of Sumatra by Mr. Curtis (whose name it bears), a traveller for Messrs. Veitch, of Chelsea.

PIRINIX RUBROLOA.

This Palm, a handsome and useful plant for decorative purposes, has pinnate leaves which assume a graceful pendent habit, forming a contrast to many members of this genus, which are of a stiff habit. It is of hardy constitution, thriving either in the dwelling, greenhouse, or stove, excepting when subjected to too low a temperature, which causes it to appear starved, and thus detracting

somewhat from its beauty. I know of a plant which has stood in a window for the past three years without injury, a test sufficient to place it amongst the list of plants suitable for window gardening. Care should be taken not to overpot the plant. It was introduced from India in 1873, and is said to attain a height from 15 to 20 feet. I have read in some gardening journal that it is similar to *P. canariensis*, but this is an unfavourable comparison, as our specimens of the latter are almost erect, and the leaves have not the graceful habit which belongs to this Palm. *W. Harrow, Botanic Garden, Cambridge*.

APRICOTS ON WALLS AND IN POTS.

The article, p. 192, on the Apricot, by our late friend, Mr. Wildsmith, is full of suggestiveness, and is one which I quite agree with, as far as it goes. Almost every gardener in England will endorse that part of it in which he refers to the difficulty of maintaining the trees in good condition. From my earliest recollection, the difficulty of doing so has been a perplexing question, and the ablest fruit growers of more than thirty-five years ago discussed this subject, notably Mr. Bailey, of Nuneham Park, and Mr. Saul, of Stourton; the latter was a good gardener, as well as an able writer, and he advocated deep drainage, and the thinning out of the fruit-bearing spurs for Apricot walls, as one of the means to adopt to keep the trees healthy. About that time Mr. Johnson, gr. to the Duke of Wellington, at Strathfieldsaye, had, as he said, "as fine a wall of Apricot trees as any in the country," but he also, like others, failed to get good crops of fruit until the borders were deeply drained, and "the garden, from being one of the latest in the neighbourhood, to be one of the earliest," by means of deep drains. Spencer, of Bowood, also adopted deep drainage at that time, and with good results to his Apricot trees. Deep versus shallow drainage was subsequently discussed in the gardening journals, and I am not at all sure whether the advocates of drains 5 feet deep or those of 4 feet had the best of the argument. Covering the trees in the spring was also discussed, Mr. Bailey being for and Mr. Saul against its use. In my method of growing fruits, I have been greatly guided by the doings and opinions of these good gardeners of a generation ago, not following their lead blindly, but always keeping their teaching in mind. Our late friend writes of having to water the trees after the crop was taken, and I have found it advisable to do the same on light gravelly soils, but it would not do here. I found the path in front of the trees always wet after rain, and the water would stand on it for some time. In that case I set about having a drain laid along the entire length of the border and 3 feet deep. The path and the border are now quite dry after rain, and even in dry seasons we do not water the trees. The soil is rather heavy, overlying what seems to be good brick clay. The Apricot is not like the Peach, subject to attacks of injurious insects, and nearly all the difficulties that one has to encounter in cultivating it is in the roots getting into a bad soil, and which will often induce canker; and it is safe to add, that any serious check to the development of the trees is followed by the same effect, and no other fruit trees are more liable to be attacked by canker. There is no remedy when once the disease is present. I hold to deep drainage of the soil where necessary, and cropping the ground over the roots very lightly, or not at all. I am convinced of the good results following the enticing of the roots to the surface by mulchings of decayed farmyard manure and the least possible digging of the soil, and thinning the spurs when they are crowded. All or nearly all the pruning and thinning should be done soon after the fruit is gathered, and the best results are obtained when the wood is well thinned out.

Culture of the Apricot in pots is not to be recommended unless a house can be set apart for them, or they can be put with pot Cherries and Pears. I grew orchard-house trees very well for fifteen years,

and found out, after two or three seasons' failure to get a good set of fruit, while Peaches, Nectarines, and Plums set freely, that the same atmospheric conditions would not suit the Apricot. Apricots and Cherries require a very dry atmosphere when the trees are in blossom, and not only so, but the air ought, if possible, to be in motion by night as well as by day. [As it usually is out-of-doors at that season, Ed.] A roughly built house where the air can find admission by cracks and crevices is the best. In some cases I would advocate pot culture, for the reason that I never saw a tree in a pot have cankered wood, possibly because there is perfect command of the roots; in the second place, the fruit is always of splendid quality, and can be protected from wasps and premature decay. We lose quite half of our fruit on the walls if the weather is damp when it is ripening, by it decaying before it is ripe; and lastly, well grown trees in pots are a source of enjoyment to their owners all through the flowering and growing season, especially if Cherries and Pears are grown in the same house with them. Many persons have not a garden well suitable for fruit culture, and cannot have one, and such, I am sure, would find the culture of fruit under glass interesting if not profitable. We do not expect to make profits out of our hobbies. One man may build a glass house (many do) for Chrysanthemums only, and their culture is quite as troublesome as that of fruit trees in pots. The question would be, which is the most satisfying? *J. Douglas.*

THE ALPINE GARDEN.

SAXIFRAGA LIGULATA.

This well-known hardy, but common large-leaved Saxifrage is now blooming in the open border, amid fog and frost and rain. Always early to flower, it appears to have been even more so this season, owing, no doubt, to the mildness of the weather [up till recently], which finds many things in a state of unusual activity; but its beauty seems lost in the open, and this is why it is I always grow a few plants in pots in a cool-house. Clumps placed in large pots will go on flowering freely in them for years, aided by an occasional top-dressing and some manure-water. When a specimen becomes unduly large, it is taken from the pot, divided, and planted out in the open for two years, in which time they attain to a blooming size, and can be potted under glass, and without the aid of artificial heat the flowers are produced in large panicles; they are deeply coloured and pure, because their lustre is undimmed by any taint from rain and fog. I wonder this plant—common as it is—is not more grown for cutting from at this time of the year, for it can justly lay claim to a large share of vernal beauty. I took a panicle of charming pink flowers to a Court florist in London a few days ago, who I imagined was well acquainted with the flowers that put in an appearance at this season of the year, and he asked in wonder and delight what it was. Not a particle of artificial heat is required to have it in flower in the early part of February. In early spring the plants can be stood out-of-doors, and remain there all the summer and until the autumn. I find the specimens in pots very useful for furnishing my forecourt garden during the summer. They put forth a lot of large bold leaves, which have quite an ornamental appearance. Other of the large-leaved Saxifrages are also useful for the purpose, but *S. ligulata* specially, because it blooms so early. *R. D.*

LYCHNIS LAGASÆ.

This pretty little alpine is often offered in nursery catalogues, being very easily raised from seed which it ripens abundantly, and looking very neat and gay when flowering in small pots in a frame. But to make it a perennial out-of-doors in England has puzzled most cultivators. It forms a small evergreen bush, with very fragile stalks, 3 or 4 inches high, and is quite unfit, in ordinary exposed positions,

to endure the alternate snows and rains of an English winter. I formerly used to plant it in recesses under overhanging stones in a rock bed; but it never seemed to like being covered overhead, and used to lean forward to get out. For the last two or three years I have tried it on the perpendicular side of an old brick wall with a north-easterly aspect, where it continues to do well, and is very ornamental when in flower. *C. Willey Dod.*

SPRING-FLOWERING IRISES.

THE enthusiasm displayed for these lovely plants manifested by Professor Foster has stimulated others to undertake their culture. As a consequence, many more species and varieties are known in gardens than was the case a few years since. In beauty they stand a comparison with Orchids or any other group, but they have one defect, which in these days is a serious one—they are not useful for "cutting." This does not make much difference to the botanist and the enthusiast, for hardy spring flowers are always specially welcome, and if one flower melt away, another takes its place. *Iris Bakeriana*, of which we give an illustration at fig. 45A, from a plant which flowered at Kew, is in habit like *Iris reticulata*, but the leaves are cylindrical and eight-ribbed, and the flowers have the fragrance of Violets. It was originally described in the *Botanical Magazine*, tab. 7084, by Professor Foster, and is further alluded to by Mr. Lynch in our issue for January 11, 1890. His remarks were supplemented on January 18 by some valuable notes from Professor Foster, who alludes to the great variability of the plant. The plant is a native of Armenia.

Iris Bornmülleri (fig. 45B) is a dwarf yellow-flowered species, in which the petals or "standards," of garden nomenclature, are so arrested in their development as to be almost obsolete. It was originally described in the *Flora*, 1889, p. 140, and is considered to be closely allied to the Armenian *Iris* (*Xiphion*) *Danfordia*. A full description, from a plant grown at Kew, is given by Mr. Dewar in our columns, January 25 of the present year. Like the preceding, the plant is a valuable addition to our spring flowers.

THE CLEMATIS.

THESE beautiful hardy climbing plants, of which there is such a large variety, are classified under the following types, and taking them in their order of blooming, the first is the *Montana* type, and which are spring bloomers. The most important are *C. montana*, which flowers in large clusters in the month of May. Next come the *Patens* type, consisting of very bright, showy varieties, blooming principally during May and June, and of which the following are a few of the best:—*Albert Victor*, *Miss Bateman*, *Miss Crawshaw*, *Mrs. George Jackman*, *Mrs. Quilter*, and *Stanishii*.

These are succeeded by the double and single blooming varieties known as the *Florida* type, which flower during June and July; the best varieties are *Belle of Woking*, *Countess of Lovelace*, *Duchess of Edinburgh*, *Fortunei*, *John Gould Veitch*, and *Lucie Lemoine*. All the above mentioned types flower on the previous year's wood, if well ripened, so that only the weak, straggling, or overcrowded branches should be pruned out, if a fine display of bloom is to be obtained; and this should be done as soon as the winter frosts are over.

The *Graveolens* type are late summer bloomers, but little planted; and except to run over thickets, or over the stems and boughs of trees, the flowers being small and poor in quality. Of these are *C. vitalba*, though this in the autumn is very conspicuous, with its shaggy plumose fruits, from which it has gained the name of *Old Man's Beard*. It is also commonly known as *Traveller's Joy*, or *White Vine*.

The *Lanuginosa* type are the next in succession, flowering from July to October, and very effective

the fine and large blooms of some varieties are. *Alba Magna*, *Blue Gem*, *Fairy Queen*, *Gem*, *Henryii*, *Lanuginosa*, *Candida*, *Malame van Houtte*, *Princess of Wales*, and *Purpurea elegans*, are amongst the best. These varieties flower successively on the short lateral summer shoots, and should therefore be pruned down to about 3 feet from the ground every spring, to prevent them becoming long and bare of young shoots near the base, the tendency of the plants being to develop new growth at the extremities.

The *Viticella* and *Jackmanni* types flower at the same time in profuse continuous masses on the young summer shoots till the frost comes, making them very attractive. Of the former type the following might be mentioned:—*Ascotiensis*, *Lady Bovill*, *Mrs. James Bateman*, *Viticella rubra grandiflora*; and of the latter, *Gipsy Queen*, *Jackmanni*, *Madame Grange*, *Rubella*, *Jackmanni superba*, and *Velutina purpurea*. These should be pruned so as to assist the development of strong shoots by cutting back the summer growth as soon as the frost has disfigured them.

Clematisses grow freely in most garden soils which are of good texture, but where it can be provided, a rich loamy soil is the best, and if this can be mixed with chalk or lime it is generally found beneficial. Thorough drainage is absolutely necessary to grow good healthy plants, and their strength should be maintained by manuring with horse or cow manure at least once a year. For planting, the spring and autumn are undoubtedly the most suitable times.

The uses to which the Clematis may be applied are numerous. They may be trained up verandahs, walls, or trellis-work; made to climb up poles, forming pillar plants; be festooned, run over masses of rockwork or rootwork, or trained over iron supports as specimens for lawns. The summer and autumn flowering varieties are also used as bedding plants, the young shoots being pegged down before they get entangled. The best effect is obtained by raising the surface of the bed, or using hooped rods, to display the flowers better, and edging the bed with white or yellowish foliaged plants. The beds should be well manured and trenched before planting, and I should recommend, where it is possible, to plant the Clematis permanently, so that they should not be disturbed, as each year they would get stronger, and flower even more profusely. *A. G. Jackman, Woking.*

ROSES.

TEA ROSES.

THE remarks on this subject by "Wild Rose" at p. 131 contains much useful general information on the quality and comparative hardness of some of the varieties. No doubt some growers were anxious to contribute their quota of information to the Rose Conference, and sent in a list of names without sufficiently testing the merits of the different varieties under varying systems of culture. There could not be many of this class, and the aggregate mass of information would be sure to come out right, so that the *Chiswick* Rose Conference stands out boldly as one of the greatest floricultural, and, one may certainly add, botanical achievements of the year 1889. It might be well, when lists are sent in containing palpable errors, to consider whether it would be better not to publish them at all; for instance, *Madame Falcot* is one of the most popular of Tea Roses—it is so very beautiful in the bud state; but if it is recommended as an exhibition Rose on the strength of its popularity as a pretty little thing for button-holes, one must conclude that the person doing so cannot have had sufficient acquaintance with show Teas; nor is anyone who does not know a Bourbon from a Tea Rose better qualified to give a list of the best Teas for any purpose whatever. The Conference has certainly served the very useful purpose of bringing before the public the names of the best varieties in the various classes. This is a most important con-

sideration for those who have to purchase Roses. The trade lists are far too long, and they always have been so. I have been perusing a list of Roses published in 1833 by Mr. Wood, nurseryman, Woodlands, Maresfield, Sussex, and of Paris, and it contains just 1000 varieties of garden Roses. Under the heading, Tea-scented Roses, there are ten varieties only, viz., Belle Felix, rosy-lilac; Bourbon, white; Boutelalaie, pink; Hymené, white, yellow centre; Jaune Panachée, straw-colour and rose; Large Crimson, splendid crimson; La Surprise, rose; Rose du Bonheur, rosy-blush, yellow centre; Roi de Siam, pure white; Strombio, cream colour.

Roses. The Tea-scented Roses had not been thought of as autumn bloomers at that time. I have just turned to a report of the Grand National Rose Exhibition, held in St. James's Hall on July 1, 1858 (not July 3, as stated in Dean Hole's speech at the Conference), and on carefully scanning the names of the Roses exhibited, I find the following Teas only:—Souvenir d'un Ami, Gloire de Dijon, and Madame Bravy. Now Teas are the most popular of Roses, and deservedly so. They may be grown in every garden, for if the soil is not suitable, it may be made so. I have grown them in light sandy soil over gravel and also over very heavy

greatest vigour on their own roots. Safrano, an excellent variety in the bud state, was particularly vigorous on its own roots. I planted some hundreds of seedling Briars, and budded them where they were intended to bloom, but we had a deal of trouble with suckers—still they are not so bad as the Manetti; I therefore go in for own root Tea Roses, and those that may be budded on the seedling Briar.

In the heavy brick earth on a clay bottom, cold and wet, we have raised the beds quite a foot above the surrounding surface, and banked up the sides with turf; we filled up the beds to the above height with decayed turf, and some rotten manure. The ground sunk considerably the first two years, and the fresh lot of loam required to make up the beds again was an excellent stimulant to the Rose bushes, for it is not well to continue to replant the Roses year after year on the same space of ground without any addition of fresh loam, and even with that, they are not likely to do so well as they would if a fresh bed had been provided for them. I gave up standards because they were much injured or altogether killed in severe frosts. I have not planted any on the Manetti for many years, but confine all Roses, and those intended for pot-culture as well, to their own roots or those of the seedling Briar. The time of planting is of some consequence, and in this connection the nature of the soil must be considered, for it cannot be supposed that small plants of Tea Roses with stems not larger, perhaps, than a goose-quill, planted out in the autumn, will pass through a severe winter in a cold clay soil. It would be far better to plant them out from pots in March or April, as in that case they would have a good chance to become well established during the summer, and flower in the autumn. It is a good plan to place decayed manure around the roots of newly-planted and old Roses before frosts set in. *J. Douglas.*

CLIMBING NINETOS AT HOME.

A few days ago, in looking through the well-appointed nurseries of Messrs. Keynes, Williams & Co., Salisbury, I was pleased to see a fine specimen of this Rose in full flower. The plant is growing in an 18-gallon petroleum cask, with the bottom removed, ample drainage and good loamy soil being provided; and last year some of the leading shoots attained a length of 37 feet. These were trained underneath the roof of a span-house, the tub being stood on the floor at the north end of the house, which runs north and south. Thus trained, the wood got thoroughly ripened before the fall of the leaf; the strongest shoots were then shortened back to promote a balance of growth in the plant, the weak ones being spurred back, as in a Vine; with the result, that in due time the several shoots pushed into growth as regularly as a well ripened young Vine would do. The plant in question was started only two months ago—that is, the house having a bed of tan in the centre, and a stage on either side for propagating purposes—was kept close then. Now the roof, both sides, is furnished with fine healthy foliage and substantial blooms for a distance of about 25 feet. The blooms number about 150, and twice as many are showing in the bud. Of course a plant of this description requires and receives generous and judicious treatment both at root and branch, in order to maintain it in such a fine free-flowering condition. The roots are, therefore, kept well supplied with clear water and liquid manure during the growing season, with an occasional surface-dressing of artificial manure before giving water. This is evidently a very valuable Rose for private and marketing purposes. *H. W. Ward.*

FIG. 45.—HARDY SPRING FLOWERING IRISES: A, BAKER'S IRIS, FLOWERS PALE BLUE, SPOTTED WITH BLUE; B, BONNÜLLER'S IRIS, FLOWERS YELLOW. (SEE P. 292.)

Mr. T. Rivers, jun., of Sawbridgeworth, published his *Rose Amateurs' Guide*, in 1839, and gives an interesting chapter on "The Autumnal Rose Garden," but in the descriptive list, I do not notice the names of any Tea-scented Roses. Lee's Crimson Perpetual was thought at that time to be one of the best autumnal Roses. It having been raised from seed in the garden of the palace of St. Cloud in 1812. He says of it:—"Every garden ought to have a large bed of Crimson Perpetual to furnish bouquets during August, September, and October. Their fragrance is so delightful, their colour so rich, and their form so perfect." Mr. Rivers was of the opinion that the old red and white monthly Roses were concerned in the parentage of the perpetual

brick earth. In the former case they were planted on the level ground, the gravel being so near the surface, that it had to be removed, and its place supplied with some heavy loam; a depth of 18 inches was obtained over the gravel, and some good manure placed at the bottom of the trenches; and more of it, with another layer of it 6 inches or so under the surface. I have tried all sorts of manure for Roses, that from the pig included; but I believe the best is a mixture of equal proportions of cow and stable manure. When the two are thrown up together they evolve a gentle heat. I tried on our light gravelly soil Teas as Standards, also dwarfs on the Manetti seedling Briars, stocks, and on their own roots; some of them grew with the

A WITTY FLORIST.—At a florist's.—Customer: How much for the Lilies of the Valley? Florist: Five shillings a bunch. Customer: Too much. Florist: Well, madam, if you will have the Lilies of the Valley, you must pay the "valley" of the Lilies.

THE HERBACEOUS BORDER.

DWARFING HARDY PERENNIALS.

By continued observation in the direction of dwarfing plants, I am enabled to speak with confidence. In making selections of hardy herbaceous plants for given purposes from time to time, I have been compelled to omit many of the best and showiest by reason of their height, but this inconvenience is now overcome, by adopting the cutting down or "dwarfing" plan; for example, in years gone by I should never have thought of including *Chrysanthemum serotinum* or *Pyrethrum uliginosum*, as it is more generally called, in a collection of plants suited to a border not more than 3 feet wide, but to-day I do not hesitate in the least, by cutting down this plant it may be had in all its beauty and freedom of flowering at from 2½ to 3 feet high instead of 6 feet. It is in consequence a plant of far greater value than hitherto; the value of this method of dwarfing was discovered a few years ago, and quite accidentally. In the month of June I had occasion to move a large batch and replant for stock purposes, at this time it had made about 18 inches growth, and knowing that these latter would never pick up again after having once flagged greatly, I pruned them back to about 9 inches from the base, replanted them, and gave them a thorough watering.

A week or two later, in spite of this apparent unfavourable treatment, the plants began to break away freely, and eventually they flowered at their usual time, though of only half the common height. The bed, in fact, was very effective, with its hundreds of large white blossoms, and not more than 3 feet high. I at once saw that plants so treated had increased value, and every year since I have allowed the plants in one-half of the bed to attain to their full height, and cut the other half down at the time stated, to serve as an illustration to visitors. For large beds in parks this plan so treated would be an excellent subject.

Having satisfied myself of the utility of the method, I resolved to ascertain how it might be extended to other plants, with the result that it is equally suited for all the taller Michaelmas Daisies, the taller herbaceous Phloxes, Santolwers, Heleniums, many of the taller Campanulas, Delphiniums, and others of similar growth. All these are rendered eligible for even small borders, from which they were often excluded on account of their altitude. The adoption of this method will tend to open up a wider sphere of usefulness for tall-growing plants, and greater numbers may now be employed in gardens, where hitherto they were not admitted. *E. Jenkins.*

TREES AND SHRUBS.

THE FLOWERING ASH (FRAXINUS ORNUS).

Now that the planting season is on, it may be well for me to direct attention to this handsome, but neglected tree. The Manna, or Flowering Ash, a native of the South of Europe, was introduced to this country in 1730, and it is somewhat remarkable that it should still be rare in our gardens. At Holwood, near Bromley, Kent, there is a specimen growing which is fully 35 feet high, with a stem girthing 4 feet 7 inches, and 3 feet 11 inches, at 3 feet and 5 feet from the ground, and the spread of the branches 27 feet in diameter. This tree has a nicely rounded head, is well and evenly branched, and when laden, as it is every year in the spring, with panicles of large cream-white flowers, is as pretty as it is unusual. The flowers are of good substance, and remain good for a long time. It is hard to propagate, and this may be one reason for its present scarcity, and as it is seldom asked for in our nurseries, a large stock of it is not kept on hand. *A. D. Webster.*

VEGETABLES.

CELERY.

It seems to be the custom with many cultivators of Celery to choose the largest kinds, and, as a corollary the tallest growers, which, in my opinion, is a great mistake, as in general the tall varieties are much less solid in texture than the rather dwarf Celeries, and these latter require considerably less earthing and protecting to blanch and tide them safely through the winter. Anyone who has grown the two must have experienced this, and they have been most fortunate, if at the time of using the long stalked varieties they have not found them pithy, a very common occurrence, though such may answer for culinary purposes. As flavouring, they are quite unfit to serve as a salad. I had the best Celeries for eating in the raw state are Vitch's Solid White and the Sandringham or Incomparable White, and the varieties though dwarf in stature are massive and have few outside leaves, and much heart, which, owing to their compactness of growth, blanch very easily, and are of sweet flavour; some gardeners consider the Reds to be harder than the Whites, and it may be that they are so, and if so, I know of none better than Major Clarke's, which is of medium height, and compact in texture. To have Celery in use in the autumn it is necessary to sow by the end of February, but as plants raised thus early cannot be relied on to stand long without bolting, the main crop should be sown till towards the end of March, and then it is a good plan to have a bed of mild fermenting material made up, on which to place a frame to sow the seed in. If this is done on fine light soil, pressed quite firm and level, and the seed just covered, it will soon germinate, and should then have air, when the weather is favourable, to keep the young plants from drawing. To prepare these, and have them sturdy, with plenty of roots, choose a site with a solid bottom, and put 9-inch boards round it, so as to make up a temporary frame for any old spare lights to be laid on to protect the young Celery. This done, the next thing is to spread a layer, 2 inches thick, of old Mushroom dung, or very rotten leaves, and on it a little soil, and then prick out the plants at about 4 inches apart, keeping them close and shaded for a few days or a week to give them a start, after which full light and air must be given. What has to be attended to when this stage is reached, is that the plants should never get dry at the root, as that tells much against them, and is a frequent cause of their running to seed. It will be found that Celery treated in this manner will lift with firm masses of roots from the hard floor, and will go out into the trenches without feeling a check. We always have ours between Peas, as both crops are benefited, the Peas by having plenty of room, and the Celery slight shade, which, in the summer months, is just what it likes. *J. Sheppard.*

PLANTS AND THEIR CULTURE.

TREATMENT OF FORCED PLANTS.—Plants that have been forced are often placed by the gardener on one side, and neglected till it is too late in the year for new growth to be made that will be of any use for next season's bloom. I know that at this period of the year there is usually a want of space in many gardens, still much may be accomplished if means are taken to give the forced plants a place in which they may continue the growth commenced in the forcing-house. For this purpose, fruit-houses are often available, and the back parts of plant-houses and frames, but I do not advise the use of the fruit-houses in cases where the plants are infested with mealy-bug or scale; moreover, I consider it to be a waste of time to force plants that are infested with mealy-bug, as the warmth soon increases the mischief. Any hardy plant that has been forced should have suitable shelter given it, as exposure out-of-doors

for one cold night will do great mischief, and this plan should be followed even if the plants will not be required for the next season. Azaleas demand especial care. Indian Azaleas when past their best should have all the seed-vessels removed, and be placed in a house with a moist-growing temperature of 55° to 60° at night. In greater warmth than this, or when placed close to hot water-pipes, thrips become very troublesome. I would not advise placing these plants in ainery, they being liable to be infested more or less with thrips and red-spider. Any of the Azaleas which may be infested with either of these insects should, after blooming, and before more new growth is made, have a thorough syringing with tobacco water and soft soap, or other insecticide. As soon as new growth commences, the plants may be watered occasionally with a fertiliser. Small plants should be repotted before placing them in heat, using for the purpose good peat and plenty of coarse silver sand, well-drained pots, and doing the potting firmly. The mollis varieties of Azalea should, if possible, be kept growing in an intermediate temperature, such as is afforded by ainery or Peach house just started. These plants may in a few weeks be removed to a cold house or pit, and gradually hardened off.

Deutzia gracilis should have extra care, so as to get strong plants for next season, and need to be treated like the Azalea mollis, but if not in good condition they should now be repotted, and have a few of the strong roots shortened; the plants may be grown for a time in a warm house. Spruces should be protected until the time arrives to plant them out in the open. Primulas, in order to bloom well next year, need protection in a frost-proof house for a time. Most hardy plants, as Rhododendrons, Viburnum opulus, Andromedas, and the like, are all of them benefited by not being exposed to frost at this season, but gradually hardened off, and finally plunged or planted out on a warm border. Lilies of the Valley after forcing, if kept moist in a cool frame, matted up at night, and planted out, are very serviceable for cutting purposes after the offsets have reached two years of age. They require a good compost at planting. Most kinds of bulbs are serviceable if protected in this way and given a place in the open ground, producing much bloom the following year. When planting the Lily of the Valley and bulbs, care should be taken first to divide them. *Geo. Wythes, Syon House, Brentford.*

THE ORCHID HOUSES.

THE INMATES OF THE EAST INDIA HOUSE.—Calanthes of the Vetchii and vestita sections are now sufficiently forward in growth for repotting, which ought not to be delayed, the young growths being liable to get bruised if it be done late. The compost may consist of about three parts fibrous loam, that is fresh-cut turf well pulled to pieces, with one part of peat and chopped sphagnum moss, and the addition of a little silver sand. The compost should be moist, but not sufficiently so to bind together; the size of pots may be twenty-fours (7 inch), and these may be filled to about three-parts with potshards, a little sphagnum moss being placed over these to keep fine particles of compost out of the drainage; and lastly, about an inch of the compost is placed over this last, and rammed down firmly. The pseudobulbs, if large, may be put to the number of four, and if of ordinary size, five are not too many to put into a pot, each being placed in position and the soil made firm about it before another is placed in the pot. When finished, the soil should only be about three-quarters of an inch from the rim. This will give space for watering when the roots and growths are well advanced. No water will be necessary for at least three weeks after potting, and, if possible, newly potted plants should be placed upon a shelf or stage-very near to the glass, and in a temperature of 65°. Where a plant stove is at command, it will be found one of the best places for Calanthes at this period, much heat and moisture being alike necessary. Great care must be exercised so as not to syringe the pseudobulbs overhead when the young growths are coming through the soil, or spotting will at once occur with its attendant ill-effects. *Maxillaria Santhiana* does well with us in this house. *Celoglyna barbata*, a useful winter flowering species, is now starting to grow, and should be repotted, if found needed; a compost of one-half peat and one part turfy loam and sphagnum moss is suitable. *Epidendrum nemorosum* should be kept dry, the pseudobulbs

being just preserved from withering. Once a week mild fumigation may be done, to keep thrips and aphids in check, care being taken that the leaves of the plants are quite dry at the time it is done. The house should be syringed twice a day.

Where warm Orchid houses have an arid atmosphere, the present time is a good one to plant out some ornamental foliage plants under stages and on the walls, these things adding to the appearance of a house, and retaining moisture better than bare surfaces. Suitable plants are Fittonias, Tradescantias, Panicum variegatum, the Rex varieties of Begonias, Selaginellas, dwarf and tall Ferns, *Hoya carnosa*, Philodendrons; burrs from the brick kiln, and masses of tufa or soft sandstone have a like effect in retaining moisture.

The Intermediate-house.—*Vanda tricolor* and *V. avialis* should be shaded from sunshine, and but little water supplied to them as yet, the small quantity the plants require being given with the syringe. Plants which are bare of foliage should have their stems syringed to induce the forming of new roots at that part. *Vanda cereulata* should now be repotted, and little water given it for the present.

The re-potting of *Angulosa* may now be done safely, a compost of turf, peat, and sphagnum moss being employed. It is better to pot or dress these plants before they lose last year's foliage, the roots then being less active, and less susceptible to injury. Scale is a pest to which these plants are very subject, and to rid them of it, they should be sponged with soft-soap and water occasionally. The temperature at night may be 75°, with a rise of 10°, with sunshine by day, but less than this will be sufficiently warm for the plants if the weather be sunless. *A. G. Catt, Parkfield, Worcester.*

THE FLOWER GARDEN.

BEDDING PLANTS.—Continue the potting up of all autumn and spring struck cuttings—the latter as soon as they are sufficiently rooted; and keep all of them in a temperature of 52° to 60° by night, until they have become established. Pot off or prick off into pans and boxes seedlings of plants, the seeds of which were advised to be sown in the previous Calendar, not allowing the little plants to remain in the seed-pots till the roots get interlaced, but taking them in hand as soon as a few true leaves are made.

Propagation.—Push forward the propagation of tender bedding plants, and afford the cuttings increased temperature, which they will now stand. No time should be lost, the importance of strong and well-established plants at bedding-out time not being possible to gainsay. By a neglect of this precaution a considerable part of the season goes by before any fine effects can be looked for. Cuttings of *Pansies* should now be put in for late summer flowering plants.

Seeds of all the flowering plants used in the flower gardens should now be sown, and these should include *Asters*, *Zinnias* (both the tall, and the dwarf *Haganna* varieties), *Ten-week Stocks*, *Verbenas* (especially the striped varieties), *Petunias*, *Pelox Drummondii* (including *P. D. cuspidata*), herbaceous *Phloxes*, &c. *Sweet Peas*—that is, for early bloom, sowing them like the earliest culinary peas in pots and hardening-off. All seeds of summer climbers, such as *Cobaea scandens*, *Tropaeolum canariense*, *Lophospermum*, *Maandraya*, &c., require to be sown now, if they are to cover the space designed for them early in the season.

Gladiolus.—The first planting of these should now be made; it in the mixed herbaceous borders, clumps of from three to seven may be planted; but where they are grown for cut flowers or exhibition purposes, a properly prepared bed or row will be the best. In either case the soil should be deeply dug, and a liberal dressing of well decayed manure and leaf-mould added, and if the soil be heavy, a handful of sand and leaf-mould should be placed around each corn, these being placed at about 3 inches beneath the surface.

Flower-Beds.—Where the summer arrangements include *Pansies*, *Violas*, and any other such hardy subjects also flower-bed edgings of *Stachys*, *Cerastium*, *Saxifraga*, *Thyme*, &c., all of these plants may now be planted. In no case should edgings made of the above be allowed to remain for more than two years without their being divided and replanted in the spring. *D. C. Powell, Powderham Castle, Devon.*

THE HARDY FRUIT GARDEN.

ORCHARD AND OTHER TREES.—Secure all standard trees planted in the autumn to stakes, as those put to them at that time will be found to have got out of their proper position. Place a piece of hayband neatly between the tree stem and the stake, which will then do no injury to the former. Dwarf growing fruit trees may still be planted, and these, if well attended to, will do fairly well. At this place a few years ago, the building of a wall was not finished until the month of April, and for which trees consisting of Plums, Cherries, and a few Pears had been ordered to be sent at once, and some of these had started into growth, and a few were in bloom. The tree border was ready, and holes were dug in readiness for their reception when they came to hand. After being planted, they were kept syringed daily, and sometimes three times a day, and were shaded. The result was that every tree made good growth and some fair sized fruits were gathered. I mention this to show that when circumstances have prevented the operation of planting being done in due season, trees may still be planted if extra care be taken. Early forced Strawberry plants if intended to be planted, a good practise generally, should be carefully hardened off in cold frames or under some kind of protection, so as not to have their crown buds damaged by frost. *A. Evans, Lytch Hill, Haslemere.*

FRUITS UNDER GLASS.

Peaches and Nectarines.—Early-house fruit will now require judicious thinning. One fruit to a square foot is the orthodox quantity, but seldom carried out. Over-cropping is a serious matter; it is better to have fewer good fleshy fruits than a larger number of stones and less flesh. Disbudding will require weekly attention, shoots having healthy swelling fruit at their base should be stopped at three leaves, and shoots retained should be tied occasionally. Give the warm borders rather weak liquid manure. Shut up early before the sun leaves the house, giving a good shower bath. Night temperature, 60°. Keep a look-out for aphids, and fumigate slightly for two or more nights in succession when the foliage is quite dry. Give an occasional syringing with clarified soft-water, and also damp down with strong liquid manure at closing time, both being preventives of insect attacks. Allow the sun to run the temperature up to 90°, with judicious ventilation; but be on the alert for draughts, so prevalent in this month from dry east winds. Second and later houses must have daily attention. Pull off deformed flowers, and those growing underneath the branches, leaving only those best placed. Spar flowers also may be thinned, and where two or three flowers are in a cluster, reduce these to one. Close all houses at least an hour before the sun leaves them to economise fire-heat.

The Strawberry house.—Remove pots of ripening fruit to a warm dry shelf near the top ventilators, to improve the flavour, water with clear water, and do not hurry the colouring. Keep successional plants more moist after flowering, give a night temperature of 50°, and the day temperature may run up to 60° to 80° by sun-heat and ventilation. The small flowers and weak trusses of plants in flower may be thinned; six to eight fruits to a 5-inch pot will be found a fair crop. *La Grosse Sucrée* is the best early forcing Strawberry. Place into the pits fresh batches of plants according to demand. Syringe twice daily all plants except those flowering or ripening. Plants on turf shelves will be assisted if a 6-inch square of dry, hollowed out a little in the middle, be placed under each pot. The roots will soon benefit from this.

Young Trees.—Cutbacks for next year's supply should now be shaken out, and repotted into 12-inch well-drained pots, using the best procurable turfy loam, mixed with some 3-inch bones and cold mortar rubble; plunge in bottom-heat of 70°. Successional vines should be tied into place, and the disbudding closely attended to. Gradually withhold syringing of the foliage, and remove the beds of fermenting material, if any, from the house, and keep a sound covering on the outside borders. The present is a good time for starting a house of *Madresfield Court Vines*, *Muscats*, *Lady Downes' Seeding*, and other late varieties. Vigorous canes

should be tied down bow-wise to induce a regular break of the back buds, and to this end the ammonia arising from a heap of fermenting materials within the house will assist the outer border being covered to protect it from snow and rain. If late Black Hamburgh Grapes are required, the house should be kept open, dry and cool, until the vines start of themselves.

Early Melons will in many cases have reached their trellis, and by way of prolonging the ripening of the crop, I recommend every alternate plant to be stopped as soon as four or six leaves are on the trellis, setting the crop from the laterals springing therefrom. Allow the other plants to go nearly to the top of the trellis before stopping their leaders, removing the lower laterals as soon as seen. Add a little fresh fermenting material as required, in order to maintain a bottom-heat of 80° to 90°; encourage sturdy, healthy growth, to stand sunshine later on, without which luscious fruit cannot be obtained, and no forced fruit better repays generous treatment than the Melon. Prepare successional plants for planting out, *See Blenheim Orange* seeds now. This kind will perfect splendid fruit in the ordinary dung-frame, if well prepared and skilfully handled; whereas for house culture, under liberal treatment it will (if true) be found the very best of Melons. Grow in heavy loam, well rammed.

Cucumber-house.—With increased light, better growth and fruit will be made freely by the vines sown last August for some months yet, if not over-cropped. Crowding of the foliage, followed by hard prunings, is ruinous to Cucumbers; moreover, they are often planted too thickly, for no plant better likes extension training. They require but little top ventilation; indeed, market-growers' houses are often erected without it, and the atmosphere cannot well be too humid and close. Prepare plants for the dung-frames, sowing at once a good strain of *Roullinson's Telegraph*. The materials for these frames should be well sweetened, and its gross fermentation subdued by two or three turnings before the bed is built up. Soil of a lighter character than that chosen for Melons is desirable, using a small quantity at first, as best results are obtained by frequent top-dressings. *W. Cramp, Madresfield Court, Malvern.*

THE KITCHEN GARDEN.

FORCED POTATOS.—Potatoes in frames should be carefully examined; give tepid water if dry; water, however, should be sparingly given till the plants attain good size. It is best to give the waterings on bright mornings, so that the leaves may get dry before night. When the plants are 6 to 8 inches high, earth up with moderately light soil slightly warmed, raise the frames, if movable, to prevent the tops coming in contact with the glass; give abundance of air at all favourable times, but avoid a cutting draught; also, well cover up at night to prevent a chill.

Parsley, early sown in pans or boxes in mild heat, should be pricked off either into small pots or boxes, allowing 2 or 3 inches between the plants. Place the pans as near the glass as possible. With care these will produce an abundant supply several weeks before the outside sowings.

Brussels Sprouts and Cauliflowers should now be pricked off in boxes; this should be attended to early, or damping off will ensue. Of the *Esport* type three may be pricked into a pot, to be subsequently thinned out and planted without separating them; but the larger types will require much more room. If seed of the former has not yet been sown, no time should be lost in getting it in, especially in cold northern districts, it being essential to get good strong plants at an early date.

French Beans.—To assist the formation of good fat pods, give weak liquid manure, each alternate watering—that made from deer or sheep droppings suit beans well. Syringe the plants twice daily, except on wet or foggy days, and pick off the pods, when large enough, so as to give the smaller ones a better chance to develop. These pods may be tied up in bundles and stood with the ends in water, and placed in a cool spot, when they will keep for a few days. Place twiggy sticks to succession plants, when large enough, first top dressing if required; sow more seed every fortnight, either in fruiting pots or small 60's, according to circumstances. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

NEWSPAPERS. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, MAR. 11. Royal Horticultural Society, Fruit, Floral, and Scientific Committees, and Lecture.

SHOWS.

WEDNESDAY, MAR. 12. Royal Horticultural of Jersey, Royal Aquarium: First Spring Show (two days).

SALES.

MONDAY, MAR. 10. Lilies, Greenhouse Plants, &c., at Protheroe & Morris' Rooms, Nursery Stock at The Nurseries, Roundell, at Protheroe & Morris' Rooms.

TUESDAY, MAR. 11. Roses, Greenhouse Plants, &c., at the City Auction Rooms, at Protheroe & Morris' Rooms.

WEDNESDAY, MAR. 12. Roses, Fruit Trees, Shrubs, Border Plants, &c., at Stevens' Rooms, Lilies, Roses, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.

THURSDAY, MAR. 13. Orchids in Flower and Bud, 10,000 Liliam auratum, &c., from Japan, at Stevens' Rooms.

FRIDAY, MAR. 14. Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK. — 42° F.

A CONSIDERABLE number of suggestions, some of a contradictory character, and others that are impracticable, have, we learn, been received by the committee appointed by the Royal Horticultural Society to consider the subject, but these being still under consideration, we are not at liberty to say anything more about them at present. If, however, we may judge from the correspondence that has reached this journal on the subject, it would seem that there is a pretty general unanimity of opinion except upon one point, and that is as to the form of nomenclature to be adopted for minor variations and for cross-bred plants. All agree that Latin names, given and registered by a competent botanist, should be assigned to species and varieties, e.g., *Cattleya labiata*, and *Cattleya labiata Mossiae*, *C. labiata Dowiana*, *C. labiata Mendeli*, and so on; but when it comes to such variations as are represented by names as *Cattleya labiata Mossiae aurantiaca grandiflora*, or *Cattleya labiata Mossiae kermesina marginata*, there is apparently a divergence of opinion. Some are of opinion that the style of nomenclature adopted for florists' flowers is the best for such minute subdivisions, whilst others claim for them the application of Latin names, with the result as above seen. The names applicable to crosses too will need urgent attention. We need not point out the possible vulgarisms and awkward expressions that may result from names expressive of the percentage of particular varieties. Such cases might even entail an

occasional action for libel! On the other hand, if we are to combine the Latin names of both parents into one appellation, we shall have, as in the case of the *Cattleyas* just referred to, appellations of ten words in length! It would seem therefore that a middle course is preferable, and this, no doubt, will be duly considered by the Committee.

M. GODEFROY, who was asked to favour the Committee with his views on the subject, has preferred to publish them independently in a recent number of the *Orchitophile*. M. GODEFROY would call an Orchid that was worthy of cultivation by a short euphonious name: if it were ugly, then he would not object to any barbaric name being applied to it! M. GODEFROY, like every one else, would leave the naming of species and varieties to the botanist, but in the case of garden varieties raised by the gardener, he thinks very justly that the latter should be considered in the matter.

In the case of a first cross, M. GODEFROY upholds the usually adopted plan of combining the names of the two parents, e.g., *Cypripedium javanicum-superbium*; but when the hybrid is again crossed, say with *C. barbatum*, we should be burdened with such a name as *Cypripedium javanicum-superbium barbatum*, and so on. It is evident that this system would break down under its own weight. M. GODEFROY goes on to suggest that each species, say of *Cypripedium*, or other genus, should be designated by a letter, thus, *Cypripedium barbatum* would be indicated by the letters C. B.; *Cypripedium insigne* would be noted as C. I. and so on. Hybrids would be named thus:—C. Lecanum, C. I. x Sp., to indicate that *C. Lecanum* was a cross between *insigne* and *Spicerianum*. In cases where a cross was effected between a species and a hybrid, C. Schroderi, for instance, M. GODEFROY would write C. Ca x Se x Lo; that is to say, "*C. caudatum* x *Schlimi* x *longifolium*, or *Schlimi* x *longifolium* = *Sedeni*." If a hybrid be fertilised by a hybrid, e.g., *Sedeni* and *grande* would be thus indicated, "C. Sch. x C. lo x Ro x Ca." These examples, says M. GODEFROY, have not cost him anything, and he does not expect to derive much profit from them!

In all this, as it seems to us, there is an attempt to mix up distinct things, viz., the application of a name, and the history, and sometimes even the structure, of the plant. In rare instances this can be conveniently done, but in the majority of cases the attempt to combine these objects, lands us in a slough of symbols, and crosses, and syllables which, however useful for the purposes of the botanist, are worse than useless for the gardener and amateur.

One of the golden rules of botanical nomenclature is that which forbids us from attributing to any author, words or names that he did not employ, or a meaning for which he cannot justly be held responsible. Now if a Latin name be given to a plant, the inference is that the plant so-named has been examined, named, and registered by a botanist, and further that the plant is, in his opinion at least, a definite species or variety. But a Latin name as applied in gardens without authority, is, so far as its name goes, an impostor, pretending to represent something which it does not. Even when plants are submitted to a botanist, there comes a limit to his discriminating power, or at any rate to his power of so describing a plant as to be intelligible to others, or so as to admit of accurate comparison with other plants. Again the points of distinction, such as they are, may be of little

moment botanically speaking, but quite otherwise from the point of view of a horticulturist, especially of a commercial horticulturist. When this limit is reached, then we think the use of Latin adjectives should cease, and be replaced by some other system of naming.

The botanist, moreover, may be right or wrong, if right, the name he proposes will remain; if wrong, it will have to be changed, and everyone who cares to do so will be able to consult the registers and ascertain the history of the plant and form his own conclusions. But if Latin names are to be applied indiscriminately, and to variations which defy accurate definition in words, great confusion will arise, nobody will be responsible for them, and there will be no authentic record or description to refer to in case of doubt.

For these reasons, we deprecate the employment of any appellation which by its character may give rise to a false inference. If a plant has a vernacular or a fancy name, we know at once that we have to deal with a garden-plant which may be a variety of some botanical species, or an artificial production. In either case its beauty and interest are in no wise lessened by a "fancy" name, even for botanical purposes, though some fear that its commercial value might be lessened. The cosmopolitan nature of Latin is, of course, an enormous boon, and it is one of which we can, to a considerable extent, secure the benefit without engendering the confusion begot of imitating botanical names proper. Such names as *Cattleya Apollo*, *Cypripedium Minerva*, would be understood all over the world. They would be specially applicable to crosses of various degrees, if written with a x, and their history could be recorded in any suitable publication. If some scholar could devise some Latin form for naming garden plants of uncertain standing, and one which would not be open to the objection of conflicting with proper botanical names, he would be doing a service. The nearest we can get to it at present is to add the suffix *hort.* to the Latin name. This answers well in writing, but is otherwise useless. But on all these matters we may expect shortly to be guided and directed by the collective wisdom of the nomenclature committee.

THE GARDENERS' ORPHAN FUND. — The monthly meeting of the committee of the above took place at the Caledonian Hotel, Adelphi, on Friday, the 28th ult. Mr. GEORGE DEAL in the chair. The minutes of the last meeting having been signed, the Hon. Secretary read a letter of thanks from Mrs. WILKINSON, in reply to the resolution of condolence on the death of her husband, an active supporter of the Fund. Among the special donations and subscriptions handed in was one of £15 from Mr. WILLIAM ROBINSON, and one of £14 0s. 11d. from Mr. J. HUGHES, the local secretary at Birmingham; and £2 10s. from Mr. J. HUSSY, Hains Hill Gardeos, Twyford, local secretary for that district. The matter of the annual floral fête at Covent Garden in aid of the Fund, then came under consideration, and a letter was read from Mr. J. BOURNE, stating that the Duke of BRUNNEN was willing that the Flower Market should be again utilised for that purpose. It was resolved that a meeting of the standholders of the Market be called at the Hummums Hotel, Covent Garden, on Friday, the 14th inst., at 9 P.M., to solicit their co-operation in carrying out the fête, and to appoint a committee from their number to work in conjunction with the committee of the Fund. It was also resolved that, consistently to the convenience of the President, and the engagement of the 11th, the annual meeting of subscribers, the election of children to the Fund, and the annual dinner take place at the Cannon Street Hotel on Friday, July 18. The Secretary, having brought up

FIG. 46.—ONE OF THE GIANT ORCHIDS, GRAMMATOPHYLLUM SPECIOSUM. (SEE P. 287).

a statement as to the probable income of the Fund for the current year, and the sum available for allowances to children, after funding the donations, &c., as prescribed by the rules, it was unanimously resolved that ten children be placed upon the Fund at the next annual election in July. The usual vote of thanks to the chairman closed the proceedings.

RATIONALISM V. EMPIRICISM.—In relation to the very interesting discussion taking place in our columns, we may incidentally refer to one particular instance, because it is one we earnestly desire to see tested in practice by those who have the means. There is, as we have already indicated in these pages, an astonishing diversity of minute structure in the leaves of Orchids. That diversity, unless we are incapable of forming just inferences, is certainly connected with the relation of the plant to varying degrees of light and moisture. The structure in many cases furnishes indications as to the amount of shade required, the quantity of water demanded, and the power of resistance to adverse conditions. Few more promising researches could be carried out than one into the structure of the leaves of tropical Orchids, either from the point of view of physiology, or of its application to the requirements of the cultivator. The Director of the Jodrell Laboratory could institute few more important inquiries.

"KEW BULLETIN."—The last number of the *Kew Bulletin* is devoted to a list of seeds of hardy herbaceous plants, shrubs, and trees which may be had by way of exchange from the Royal Gardens at Kew. The list occupies no fewer than thirty-three pages in double columns.

THE WEATHER. It is only a short time since we were chronicling the advent of early flowers, and the writer of extraordinary Gooseberry paragraphs was in his element in the daily papers. He will have to try another tack, and the weather will help him. Here is a fact for him—the thermometer at Shirley, near Croydon, registered, on the night of the 3rd—4th, as many as 29° of frost. This is something extraordinary.

MESSRS. SEEGER & TROPP.—A short call at this compact and well-stocked nursery at East Dulwich was sufficient to prove that an interesting addition has been made to orchid-growing establishments round London. It is small in size, but not an inch of space is wasted, and every scrap of it is devoted to Orchids. Messrs. SEEGER & TROPP are importers, and dispose of their produce largely by auction sales, especially on the Continent; but that they are experts in cultivation is shown by some fine pieces of *Lælia purpurata* in variety showing for bloom, as well as forms of *Cattleya gigas*, *Sanderiana*, and a very fine sample of *Odontoglossum coronarium*, and another of *Sobralia Cattleya*. There is a very rich collection of *Masdevallias*, no fewer than 117 species being cultivated. Of course, at this season there is not a great display of flower, but there are several forms of *Odontoglossum* triumphant in bloom, various *Cypripedia*, including *C. bellatulum*, *Odontium aureum*, *Sophronis grandiflora*, and others. The strictest cleanliness is practised, and its good effects are visible in the health of the plants.

THE HORTICULTURAL HALL.—We are informed that Lord ROUSSELLE and Mr. HAYDOE have each expressed their willingness to contribute £1000 to Baron SCHROEDER'S Trust Fund.

BERLIN GREAT GENERAL EXHIBITION. FROM APRIL 25 TILL MAY 5.—The Horticultural Society of Prussia, of which His Majesty, the Emperor of GERMANY is Protector, will arrange a great general (international) exhibition from April 25 till May 5, as we have already communicated to our readers. Since that time the applications for space have increased so much, that the large space will scarcely

be sufficient. In addition to Germany, Belgium and the Netherlands specially enter into competition in truly grand style. The Reichskanzler has permitted plants from Great Britain and Ireland, also from Russia, to be sent direct to the Exhibition Hall, and there be examined as to their freedom from *Phylloxera* by Mr. W. PERRINO, Inspector of the Royal Botanic Garden at Berlin. They will require no certificate at all respecting *Phylloxera*, only a certificate from the exhibitor that the plants come from his establishment; even this will not be absolutely necessary. Those English firms which, even under these facilities will not venture to send plants are requested to send cut flowers. A supplement to the schedule will be published in a few days, with some new competitions (also for cut flowers), and with a large number of honorary prizes. The city of Berlin has given six prizes, each 500 m. (£25); His Majesty, the Emperor, a large gold medal; Her Majesty, the Empress ALEXANDRA VICTORIA, a fine vase in porcelain; Her Majesty, the Empress FREDERICK an honorary prize, as also the Duke of RATON, the Minister FINEVENTUAL, and many private persons. Applications for programmes and supplement should be made to the Secretary General of the Verein zur Beförderung des Gartenbaues, Berlin N. Invalidenstrasse 42. The term of application has been extended to March 20.

CHISWICK HORTICULTURAL SOCIETY.—Rose exhibitors have a good open class provided for them at the exhibition of this Society on July 10 next, in the form of a special prize, consisting of a Silver Cup, value 20 guineas (in addition to a 1st prize of £30 for twenty-four Roses, three blooms of a sort. There are also money prizes offered as 2nd and 3rd. The cup is offered by J. MANFELL, Esq., one of the conditions being that it must be won three times, but not necessarily in succession.

THE CANADIAN IMPORT DUTY ON FRUIT.—The fruit growers of Canada are urging a re-imposition of the import duty on fruit, as they begin to fear that without this protection the retail trade may pass into the hands of the United States.

SHOW FIXTURES.—The following dates are announced:—Maidenhead, August 14; Hammersmith, July 17 and November 6; Chiswick, July 10.

EALING HORTICULTURAL SOCIETY.—This Society, which formerly embraced Acton, Chiswick, Hanwell, and Brentford within its radius, will now confine itself to the parish of Ealing; the prizes for Roses, open to all comers, have been withdrawn from the schedule. Mr. DEAN, the Hon. Secretary for the Society for the past fourteen years, has resigned that post; his successors are Mr. J. A. DAWES and Mr. GEORGE CANNON.

READING GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—A well attended meeting of this Association took place at the "British Workman," on Monday evening, and Mr. R. D. CATCHPOOL, a Vice-President of the Association, presided. After the usual business had been disposed of, Mr. J. P. JONES gave a lecture on "The use of Flowers," and exemplified it with illustrations of table decorations. The lecture was of a varied and interesting character, and a vote of thanks was unanimously accorded to the lecturer.

THE MARKET TRADE.—Young men advertising for situations in private gardens can hardly fail to notice the number of vacancies found in market establishments. If anything could indicate the growing development of the market trade, apart from statistics, it is certainly found in the numerous advertisements of vacancies in market growing gardens. The remarkable demand now made for Tomatos has given a great impulse to trade in the market direction, and, once well supplied, other elements of a popular kind will follow; indeed, there seems to be no finality to the production of fruits, vegetables, and flowers for market sale. What seems

to be so obvious is that, in spite of extraordinary competition, money is made; but then when the control of the temperature in all glasshouses is absolutely at the command of the gardener, production of that description ought to flourish. It is out door culture which labours under so many disadvantages.

THE SOUTHAMPTON HORTICULTURAL SOCIETY.—We observe that Alderman W. H. ROOSES, J.P., has just been elected to the post of chairman of the committee of this well-known horticultural society. It seems odd that so eminent a horticulturist should not have been invited to occupy such a position earlier, but once a chairman is elected, it is difficult to replace him by another, hence an old soldier who has been not inefficient has held the post for some twenty-six years, and only gave place to a capable gardener when ill-health intervened. The Society seems to have got a little mixed in its work, having become the promoters of sports and athletics apparently far more largely than of horticulture, hence it is not a matter for surprise that its finances should not be in a flourishing condition. Should the new chairman be enabled to give to the Society a more purely horticultural aspect, and relieve it from its sport associations, it may not only occupy a higher gardening status, but be enabled to show a more flourishing balance-sheet.

SOMA.—Dr. ARCHIBOX, in a paper read before the Botanical Society of Edinburgh, draws attention to the fact that there has for some time past been a good deal of talk in India as to what the plant "Soma" of the ancients could be, as from it used to be prepared a strong drink by the priesthood. *Ephedra pachyclada* is known throughout Afghanistan as Hum—Hama—Yehma, and is at present employed by the Parsees in their fire-worship. Some suppose that this may have been the Soma of the ancients, as it corresponds in a degree to a very vague description given in the old Sanskrit writings. On my leaving Tash, in Persia, on the outskirts of the village, I came, says the doctor, upon an old woman who held in her hand a small dish, in which were some live coals. As I came near she placed some twigs on these coals; they burnt up, and gave forth an odour long forgotten by me. It was the odour of the burning of Juniper twigs; I jumped off my pony, and got my interpreter to question her for me. The lady was a Persian, a Mahomedan, making a fire-sacrifice, with good wishes for my journey, and hoping for the charity of the stranger. She allowed me to examine the twigs she was employing. They consisted of *Juniperus excelsa* and *Ephedra pachyclada*, the symbols of two very different religions—the former being used by the Buddhists, and the latter by the Parsees or fire-worshippers. Was it by accident that these two symbols were thus used together, employed by a follower of a third religion—that of Mahomet? I leave this question for others to answer.

CULTURE OF PLANTS IN ALPINE REGIONS.—M. GASTON BONNIER thus concludes a communication to the Paris Academy of Sciences on this subject, in which he shows that certain modifications and adaptations are directly due to the climate:—"Other things being equal, in plants cultivated in the alpine regions it may be observed that the branches spread more widely, are shorter and closer to the soil—that the flowers are more highly coloured, the leaves thicker and of a richer green. The protecting tissues of the stem are more developed. Owing to the greater thickness of the palisade tissue, and the abundance of chlorophyll, the assimilation by the leaves is proportionately increased."

NATURE NOTES.—Under this alliterative title the Selborne Society, with whose aims every lover of natural history must sympathise, now publishes a monthly journal. It is edited by the Rev. PERCY MYLES and Mr. JAMES BRITTON. The object is to

establish a connecting link between un instructed love of Nature and scientific knowledge, and this it will strive to compass by fostering accuracy of observation, profitable comparison, and systematic methods of study and record. The British Museum and the Royal Gardens, Kew, will be utilised, and the admirably instructive series of typical forms and structures in the Natural History Museum will furnish the opportunity for conveying knowledge pleasantly. The magazine costs but twopence per number, but its value and interest seem to be in inverse proportion to its cost.

PRIMULA SINENSIS.—Many err in growing too many varieties, and consequently having too many shades of colour. A houseful of red, white, and "blue," alone at Aldenham House, the residence of H. H. GIBBS, Esq., displays a far better selection. In about equal quantities are Chelsea Red (VEITCH), Chelsea Blue (VEITCH), and Avalanche (WILLIAMS). Mr. BECKETT has grown his Primulas well, and the effect is all that could be desired. In their own house they are kept in their batches, but when taken out for use, they are disposed as required.

CRAIG Y-NOS CASTLE.—We have been informed by a correspondent of Madame ADELINA PATTI'S wish to erect at Craig-y-nos Castle a winter garden, which will measure 104 feet by 70 feet, with a curved roof of 45 feet. The roof, which contains about 8000 square feet of glass, will be covered by Messrs. SAM DEARDS & Co., Limited, with their "Victoria Dry Glazing," which is alleged to be the only method of glazing without the use of putty which is capable of resisting the heavy gales common in that part of the country.

BIOGEOGRAPHICAL INDEX OF BRITISH AND IRISH BOTANISTS, from the *Journal of Botany* continued from p. 260:—

"MILLER, CHARLES 1739-1817: b. Chelsea, 1739; d. London, 1817. Younger son of Philip Miller. First Curator of Cambridge Bot. Gard., 1762-1770. Went to India, Sumatra, &c., 1770, and settled at Bencculen. Experimented on cultivation of Wheat. Letters to J. Martyn in Bot. Dept., Brit. Mus., Gorman, 111; Account of Sumatra in Phil. Trans., iv., 169; Rees, under Philip Miller.

"MILLER, JOHN SAMUEL, II. 1817-1828. Nurseryman. A.L.S. 1817. O.Bristol. Herbarium in City Library, Bristol? Author of 'Nat. Hist. of Crinoidæ,' Bristol, 1821. Dr. John Evans, 'Picture of Bristol,' ed. 4, 1828.

"MILLER, PHILIP 1691-1771. b. Deptford or Greenwich, 1691; d. Chelsea, December 18, 1771; bur. Chelsea Churchyard. Gardener at Chelsea, 1722-1770. 'Hortulanorum principes.' 'Gardeners' Dictionary,' 1731-1807. 'Catalogue of Trees . . . near London,' 1750 (published anonymously). 'Catalogus pl. . . in Hort. Chelseaano,' 1750. 'Introduction to Bot.' 1760. TRADE NOTICE.

SAM DEARDS & CO., LIMITED.—The first annual general meeting of this Company was held at the Company's offices, Dashwood House, New Broad Street, on Monday, February 24. A dividend of 7½ per cent. was announced.

ORCHID NOTES AND GLEANINGS.

PHAIUS TUBERCULOSUS.

THE secret of growing this handsome plant, which has baffled so many growers, seems to have been hit by Messrs. F. Sander & Co. In the warm house in which the Nymphæas are growing, the water occupies the whole of the base of the house, and suspended near the roof are large numbers of Phaius tuberculatus on rafts on which lays a little sphagnum moss only. These plants, after growing with much vigour, are now sending up flower-spikes very profusely, and some flowers are already expanded. Oncidium amplatum majus, and other plants which are not noted for being good doers generally, seem also to grow to perfection in this tank house.

GEORGEA FLACIDA.

Two large specimens of this, each with fifty or sixty of its long pendulous sprays of white flowers are now in bloom at Aldenham House, Elstree, and are such fine objects as to cause one to wonder why the fact of its being a well-known species should cause its beauty to be ignored. Mr. Beckett, the gardener, says that his plants never fail to flower well, and so do the plants of C. cristata and its varieties, whose bloom are not yet over. *J. O.B.*

HOWICK HOUSE, PETERBORO.

THE principal feature in E. G. Wrigley's fine collection at the present time is the display of Phalaenopsis, which fill the front of a large lean-to-house, facing north. There are upwards of seventy spikes of P. Schilleriana, Stuartiana, amabilis, Sanderiana, gloriosa, &c., now open, and the prospect on entering the house is a very beautiful one. The plants are in excellent condition with abundance of fine large leaves. The back stage of this house is filled with choice Cyrtopelchus in excellent condition, and C. bellatulum especially so.

The adjoining house is gay with Cattleya Trianae and Lycaste Skinneri, &c., in flower. C. Trianae alba being a very beautiful example. Some of the L. Skinneri were carrying over a dozen blooms from a bulb; L. Skinneri alba had nine flowers open, and is a good form of this fine variety, the flowers being large, very pure, and of substance. *J. J.*

CATTLEYA OR ODONTOGLOSSUMS.

Nearly every cultivator of Odontoglossums recommends the use of small pots. When beginning, many years ago, I, of course, followed the instructions of practical men, but, having remarked, during several years, that most of the roots preferred, so to say, to remain on the upper part of the pots, and that those that went deeper down suffered more or less, I tried another system. I tied the plants to sticks made of Yew, about 6 inches long, putting these into pots and filling the lower part with crocks, &c., and the rest, up to the plants, which were about 2 inches above the rim of the pots with a mixture of peat, sand, sphagnum moss, and a little good leaf mould and crocks, covering the surface with living moss, not sphagnum. Soon good results showed themselves—the bulbs grew larger and the plants improved generally. Seeing this, I went still further. I had low but broad baskets made, and planted the bulbs in the same way as above. The improvement was soon still more apparent, and many of the plants of O.

Alexandra, &c., which formerly produced only one spike on a bulb, have now two, the plants looking very robust and healthy. A young plant of O. roseum, planted in this way last year, has now on two bulbs four spikes with twenty flowers each, and there are bulbs of O. Pescatorei 4½ inches long and 3 inches broad. No stimulants are used. I, of course, do not presume to say that this system is perfection. I only wish to state the fact that under the conditions by which the Odontoglossums grow here, they have considerably improved under the above treatment. I have tried the following species:—Odontoglossum Alexandrae, O. Pescatorei, O. Rossi majus, O. roseum, O. cirrhosum, and Oncidium macranthum. *O. F., Lehnhoff.*

CATTLEYA TRIANAE MEASURESIANA.

This is undoubtedly the finest variety of Cattleya Trianae in cultivation, and distinct from all others, in its large broad labellum, which is of an intense lake-crimson colour throughout, and without margin of any other colour, so usual in varieties of C. Trianae. Near the orifice of the lip the colour deepens in intensity and brilliancy, forming an unequal ring, and being carried well back in the tube where it is relieved by a yellowish streak irregularly wedge-shaped; the sepals and petals are rosy-white, the latter very broad, forming a striking contrast to the rich dark colouring of the labellum. On the same bench, and near this matchless plant, was the true Cattleya Trianae alba, with its snow-white blossoms, and no suspicion of any other colour save and excepting the lemon blotch on the lip. This is one of the rarest of white Cattleyas, comparable, and reminding one of the beautiful C. Bluntii. *J. G.*

EPIDENDRUM RADICANS.

This remarkable species is seldom seen in gardens, owing, no doubt, to the fact that it takes up rather more space than can be well afforded to it. The plant itself, however, does not seem to be particular in this respect, as it is quite content to ramble over any spare piece of rockwork, and produce its clusters of brilliant flowers. Perhaps another reason why it is seldom seen is, that it has the reputation of being a shy bloomer. In my estimation, it seems to be as free-flowering, if not more so, than many other species which are more often met with, and are certainly much inferior to it in the beauty of their blossom. A plant of E. radicans has been flowering at Messrs. Sander & Co.'s nursery, St. Albans, since the beginning of January. It is not potted in soil, but is simply allowed to creep up the side of a piece of rockwork, to which many of its thin, white, whip-like roots cling for support. The stems, about 10 feet long, are clothed with oblong cordate leathery leaves, 1½ to 3 inches in length. The deep scarlet flowers are borne in dense clusters at the end of the long terminal peduncle, which is clothed with sheathing bracts at each node, and exudes a varnish-like substance from the upper portion. The colour of the lanceolate-acute sepals and petals, and the three-lobed lip is of a dark crimson colour, with a brilliant orange centre. E. radicans is a native of Mexico and Guatemala, and seems to have been first discovered and described by the Spanish traveller and botanist, Pavon. It is also known as E. rhizophorum, under which name Bateman mentions it in the *Bot. Neg.* in 1838—two years after its introduction to cultivation. After being known so many years, it is useless to imagine that it will ever become very popular. Nevertheless, it might be grown in collections where space is of little moment. *John Weathers.*

PHALCENOPSIS AT CLAPTON.

The extensive and healthy collection of Phalacnopsis at Messrs. Hugh Low & Co.'s, is constantly producing new species or varieties. P. casta and the delicately tinted P. leucorrhoda were followed by the beautiful P. Stuartiana, and then in quantity by the clear white P. gloriosa. Afterwards came the white Schilleriana, followed by P. Sanderiana punctata and the superb P. Cynthia, and now we have a white form of P. Sanderiana. Many of the above are still to be

found in flower, as also a large quantity of *P. amabilis*, some of which are near to the crimson-eyed *P. a. Dayana*; many *P. rosea*, both the typical form and *P. rosea leucaspis* of Rehb. f., which is destitute of yellow in the centre, and has dark crimson markings. A good lot of the fragrant *P. Schilleriana* is also in bloom, as well as some smaller species.

ANGRÆCUMS, &c.

Almost a houseful of the charming *Angræcum citratum* is now to be found in flower at Messrs. H. Low & Co.'s nursery, and many of the neat small growing white *A. hyaloides* are to be found in the same house; as also a specimen of a new kind, evidently a natural hybrid between the two above-named species in flower. The fine *Vanda Amesiana* seems to flower in quantity throughout the dull season; and in the *Cypripedium* houses, Messrs. Low's strain of *C. villosum majus* and *C. v. aurcum* are fine, and the specimens of *C. argus*, *C. Elliottianum*, *C. hirsutissimum*, and *C. callosum*, are in many instances in bloom; also the fine *C. Ainsworthii*, and many others. The *Cattleyas* have some good *C. Trianae* in bloom, and the large *Odontoglossum* houses are well set with bud. *J. O'R.*

LYCASTE SKINNERI ALBA.

The specimen of this plant in the collection of R. Young, Esq., Aigburth, Liverpool, mentioned in the *Gardeners' Chronicle* of November 9 last year, as having twenty expanded flowers, and several more in bud, has borne fourteen more blooms from the same pseudobulb, and which are of large size and fine substance. *J. G.*

RENOVATING HARDY FRUIT TREES.

It by no means follows that the only means whereby old fruit trees may be renovated is found in grafting. Where heads have become crowded with weak fruitless shoots, and the points die back because immature, the whole surface of the stem and branches is covered with cankers, and generally the trees wear an exhausted aspect, some good may be accomplished, not so much by thinning, as by literally beheading and compelling new shoots to break out all over the stumps, even if the trees be left to do their poor best under ordinary conditions fairly good stout shoots will inevitably break out; when, however, in addition to the severe beheading the stems be well scraped and cleansed of all parasites, the soil about the roots deeply forked and manured, and liberal doses of liquid-manure given them when dry weather sets in, then wonders in the way of new growth will result, and in a couple or three years quite new heads full of strength and fruiting-wood will be formed. It is, of course, needful that the shoots which break out after the beheading, should be thinned, the best being reserved to form a head of fitting proportions. The stimulation given to the roots by forking, manuring, and adding new soil, combined with the more powerful force exercised on the sap by the robust nature of the top growth and luxuriant leafage, soon produce almost new trees, which only need regular pruning and constant cultivation at the roots, to maintain them in robust fruiting condition. A very powerful influence is exercised on the roots of stunted trees by opening trenches half-way round the roots at some 6 or 7 feet from the stems, casting out the old soil some 3 feet wide, and as much deep, and filling up with fresh soil, and some manure added. By the time the roots have got a good hold of this new soil, say some three years after, the other half of the roots may be served in the same way. This plan of treatment is most useful in grass orchards, where the destruction of the pasture about the trees is undesirable. In opening the root trenches, the turf may be removed, laid on one side, and be replaced after the trench has been filled in with the fresh soil. Of course, treatment of this kind is only to be commended where the sorts are good and worthy of retention. Where the varieties

are worthless, re-grafting is undoubtedly the best form of renovation. It is not too late yet to undertake work of that sort. So far as the scions or grafts are concerned, it would have been well, perhaps, could they have been cut from the parent trees earlier; but as there is so much restfulness in vegetation just now, there is not much the matter, so far, at least, as Pears, Apples, and Cherries are concerned.

Grafting is to be governed rather by the condition of the leaf-producing sap rather than by the bottom-producing sap, and the former is always later in its action. [There are not two saps. &c.] Then in selecting wood for graft-making for large or old trees, it is not at all needful to take shoots with fruit-buds on them. The best grafts invariably are made of stout yearling growth as large round as a man's finger, if possible, but on which leaf-buds are stout and plentiful. There is an abundance of such shoots to be found yet on robust trees, and if these be taken off as hard back as well can be, tied into small bundles, and laid in some 6 inches, by the bottoms, in loose soil, they will be found in capital condition for use in April next. By having the grafts thus cut early and heeled in, they are found at the grafting time to be invariably several days later in starting leaf-buds than are shoots left on the trees. It is thus possible to command the time for grafting more easily than when shoots are left on the trees till required as grafts. Be-heading may be done at once also, although not back to the point at which it is proposed to graft; if cut to within a foot of that particular place some time previous to the final severance, which will be best left until the work of grafting is proceeding. But when the heads are removed, something may well be done at once in thoroughly cleaning the stems and branches, loosening or otherwise assisting the soil, adding manure, or in any way rendering the roots material aid. The effects of that assistance will not be immediate, but will be shown more fully when the grafts have become united later, and the sap is in full circulation. Once the junction of the graft with the stems is assured, and growth is proceeding, the more fully the roots are active the greater will be the first year's growth, and the stouter the head eventually. It is of the first importance the early growth of the grafts should be robust, as that being secured, the later development will assuredly be satisfactory. The best time for grafting is found, according to locality, to range from the middle to the end of April, and in the north even later.

As to the proper places at which trees should be grafted, that must be regulated materially by the condition of the trees, where several clean arms can be found a few feet beyond the jointing from the main stem; it is better to cut back hard to these and graft them, than to graft a large number of small stems on long arms. The labour of grafting these is great, and because they are so wide and high, are often in danger of being blown out by high winds: when the grafting is performed closer home with very stout scions, which are securely fixed and tied, it is easy later to give them some support during rough weather by means of one or two stout stakes tied to each arm, to which the graft-growths are secured. In a couple of years the union becomes so perfect, that there is little danger to be apprehended from rough winds.

Where older growths than yearling shoots offer, and in consequence are larger, the stoutest may be let into the stem, as well as into the rim, by wedge-grafting. The great object of the grafter should be to ensure quick unions, thus losing no grafts, and forcing, as it were, very robust growth, the first season. The stouter the shoots made, the more robust the foundation laid for the formation of a big head in a few years. Strong growers, such as the *Blenheim Pippin* or *Warner's King*, worked on to old stems, draw sap and develop growth on to old stems, form fine heads and begin cropping early. Probably no Apple will repay so well for grafting on to old stems in this way as the *Blenheim Pippin*. *J. D.*

NURSERY NOTES.

ORCHIDS AT HOLLOWAY.

We found a nice display recently at Messrs. Williams's nursery in North London—nowhere a great many plants together, but scattered through the various houses. The late-flowering *Calanthe mausca*, *C. Regneri*, and *C. Williamsi*, were found in quantity, and gave always a bright look to the houses. *Cymbidium eburneum* was found in two houses, blooming vigorously in each; and *C. Lowianum* was seen with six long spikes of flower-buds that will shortly be expanded. A few *Lycaste Skinneri* were observed; also *L. costata*, more curious than beautiful; and still another, *L. fulvescens*, a buff-coloured blossom. A small plant of the rare *Dendrobium Veitchianum*, better known as *D. macrophyllum*, carried one spike of three blooms. The colours of the flower greenish-yellow, dirty-white, with purple-coloured streaks on the side lobes of the lip, and purple dots on the middle lobe mark it as a singular and interesting plant. A vigorous plant would not be without effectiveness. Several *Cypripediums* were noted, including *C. Lowii* and *C. hirsutissimum*. *Vanda suavis* was found in fair bloom, and a number of *Odontoglossums*, and many more coming on; amongst the latter *O. bapianctum* in several examples, also *O. cirrhosum Klabochianum*. The Peruvian *Epidendrum lanipes*, described first by Lindley, has this year bloomed for the first time under cultivation. The flowers are yellowish. The collection of plants, besides the Orchids, is rich in *Crotons* of very high colours, and excellently grown, in *Sarracenia*s just now going over, in *Dracenas* and pitcher plants. A remarkably well grown example of *Heliconia aurea striata*, a plant that usually behaves badly under cultivation, was observed in one of the stoves. As seen, it would make an excellent vase plant for a warm room or for dinner-table adornment.

ORCHIDS AT MESSRS. BACKHOUSE'S.

When lately looking through the Orchid-houses at the York Nurseries, I noticed a grand display of *Cattleya Trianae* in the large *Cattleya*-house. I calculated that there were quite 500 flowers open. By the time these lines are in print, this number will be much increased, as many sheaths were about ready to burst. As might be expected in such a large lot, some few flowers were not quite up to the average quality; still, the number of such was small, the great majority being good varieties, with broad, well set out petals and sepals, and bold prominent labellum, many of the latter being of a purplish-crimson in the front portion, backed by shades of orange, which extended right into the throats. The plants, as a whole, were a healthy-looking lot, with an abundance of roots on the surface of the potting material.

In the same house was a quantity of *Oncidium splendendum* in bloom, some of which Mr. Bousell, the Orchid grower, informed me had been open since the commencement of the year. Also some very fine plants of *Dendrobium nobile*, which were smothered with bloom on stout healthy growths. In the cool *Odontoglossum*-house there were fully a hundred spikes open, with others in various stages. This house is glazed with rough plate glass, and judging by the healthy looking growths, its use is not hurtful.

There has been a large increase in the glass department lately in these nurseries. Two handsome, well-built, span-roofed houses, each 100 feet long by 21 feet in width, have been erected. Along the southern ends of this block a large corridor has also been put up. It is about 180 feet long by 12 feet in width. Each house opens into this corridor, which will be a great advantage from a cultural point of view, seeing that a more genial temperature can be arranged for, especially during the winter and early spring months, by opening the doors of houses when necessary, thus causing a circulation of air all through without opening the top ventilators. A smaller corridor already connected the ends facing

north; the houses run from north to south. Messrs. Richardson of Darlington are the builders. H. J. C.

Messrs. P. Barr & Sons.

In the 16 acres of land which Messrs. Barr & Sons have acquired at Long Ditton recently, quantities of *Anemone fulgens* are in flower, a most dazzling sight when the sun shines on the scarlet blossoms. If the roots of this species of *Anemone* are planted early, flowers may be gathered from Christmas onwards, and by successional plantings from August to May, a continued display may be maintained until late in the autumn. The planting made for summer and autumn-flowering must be in a situation where in summer the ground is moist, and shaded, from after 10 or 11 A.M. The full yellow-flowered *Narcissus cyclamineus* has also been, and still is, in great beauty at this nursery. It is a beautiful dwarf *Daffodil* to naturalise in grass, and charming for pot culture, the perianth being gracefully reflexed, and the trumpet of elegant form. The true *N. minimus* is a gem, as the smallest of trumpet *Daffodils*, of a rich full yellow colour, and of great usefulness for edgings, rockwork, and pot culture. It is very early in flower. Of the *Hellebores*, of which many are grown, *H. niger maximus ruber* was the only one found in good condition. B.

FLORISTS' FLOWERS.

THE CARNATION AND PICOTEÉ.

The weather is cold and winterly, so that I would advise those who are obliged to turn their plants out-of-doors after potting them, to delay the repotting until the weather changes for the better. Our plants when repotted are placed in cold frames, where they will remain until the end of the month of April. During March very little water is required, for the plants grow but little at that time, and may not need to be watered at all in that month, and it is really safest to keep them rather dry at the root.

When possible, get the potting soil in readiness some few months before having to use it. I have added to my compost this year a large proportion of old plaster, and this material being in my neighbourhood more than half road-grit, I hope it will have a good effect on the plants. Most growers will have noticed that certain varieties decline in vigour year by year, until plants and flowers become so small, that they are scarcely worth growing. A change of climate improves them, for I have sent the dwindling plants to the north of England, and have had them returned to me in vigorous health. The late Mr. George Rudd, of Bradford, used to exchange plants with me; and my plants came back from that smoky town with the leaves smeared with soot, certainly, but of a deep green colour; and it was an easy matter to pick out the Bradford plants by their stronger growth, and larger and better flowers. A change in the constituents of the potting soil might re-invigorate the plants in the same way as a change of climate; but of this I cannot say anything from experience. I grow enough plants in pots to quite fill a house 50 feet long by 12 feet wide, and which are all placed in 8 and 9-inch pots, two or three plants are placed in each pot, according to vigour, and their tendency to produce layers.

The plants out-of-doors in beds and borders have passed through the winter almost unscathed, and will be no trouble until they have made a little growth, and the sparrows attack them as usual. These depredators are scared away by white threads stretched over the plants. A new marauder has appeared this year in the form of short-tailed field-mice, which crop off the leaves of Carnations, &c., close to the stem, with the evident intention of building their nests with them, as they collect them into a heap.

It is a good time now to stir the surface of the ground, and apply a rich compost consisting of equal parts loam, decayed manure, and leaf-mould.

Tree or perpetual-flowering Carnations may now be propagated. These will be the flowering plants next autumn and winter. If very strong plants are required, they should have been propagated from the middle to the end of the month of January. J. Douglas.

MONTBRETIA POTTSII.

This plant, as seen at its best, is a most attractive Cape bulb, but it has a knack of disappointing people by increasing like Couch-grass, and never producing a solitary inflorescence. My impression is that it soon starves itself in a clump, and that it requires annual, or at least biennial, transplantation. This year we dug up a large proportion of our stock in November, and have only just replanted the tubers: in a word, we have dried them off in a cool dry shed, as is so often and successfully done with *Gladioli*. The result remains to be seen. I send you a root (fig. 47), in order to show how necklace-like one corn succeeds each other every year, and how they, by clustering closely above one another in this way, soon weaken themselves very considerably. The close allies of the *Montbretias*, viz., the *Crocasmias*, on

FIG. 47. SECTION THROUGH THE ROOT OF MONTBRETIA POTTSII.

the other hand, flower much more freely; but even these wear out, unless pretty often replanted into fresh soil. *C. aurea* is a lovely thing at its best, but the new *C. imperialis* is said to surpass it in size of flower, even if not in colouring. I shall be very glad of the practical experience of any cultivator who has succeeded in flowering *Montbretia Pottsii* year after year since its introduction ten or twelve years ago. So far, "nothing but leaves" is our portion, and we have lately utilised the foliage for associating with *Gladioli* and *Iris* flowers; but we should, after all their utility in this way, prefer to see them enlivened by flowers of their own. F. H. Eschler.

CALADIUMS, ETC.

Caladiums and *Kompebias* including *Cienkowski*, and *Monopholis*, which have been resting, will now require to be brought from their winter quarters and started into growth, which probably will be already pushing, in cases where they have had a high resting temperature, which is about 60°, they are then much more vigorous than when kept in one that is too cold: indeed any difficulty experienced in wintering those plants is generally attributable to keeping them too cold, and particularly is this the case with *Caladiums*, which are never seen better

than when kept in the stove the year round, and merely reducing the watering as the foliage ripens off, and only giving water when signs of shrivelling are observed. The soil that answers best, I have found, is a rich but rather light compost, with much decayed humus or manure in it, and where light friable loam is available, it should form at least one-half of the compost, with sufficient sharp sand to render it porous—and which would of course greatly depend in quantity on the texture of the loam. Fibry peat may be substituted for leaf-mould, but peat is always a soil poor in plant food, therefore the former is preferable. As a substitute for leaf-mould, I have used the sifted decayed waste from the *Orchid* potting bench, together with a small quantity of some prepared fertiliser such as Thomson's, Jensen's fish potash, and native guano. However, with all such finely disintegrated composts, which have a tendency to shrink and decay faster than more natural soils—the potting should be much firmer, especially if it is not intended to repot the plants during the season; and this is a point upon which there is some difference of opinion. But, except in the case of young plants, I think that neater and more enduring specimens are produced by potting the bulbs at once into the pots they are to occupy for the season. Care should, however, be taken not to water very liberally until the pots get well filled with roots, and then, if it be required, apply liquid manure regularly. We have had plants by this treatment give large leathery leaves 2 feet across in 8-inch pots.

An important point in the cultivation of *Caladiums* is to grow them with as little shading as possible, indeed, some of the finest coloured specimens I ever grew stood in a hot, moist stove, along with *Crotons*, and to which no shading whatever was put. Very close attention must be given to the watering of the plants, for, should they once get the least degree dry, a sudden collapse is the result, and some thin light shading is therefore preferable, but it should be portable, and never permitted to be over the plants when it may be done without. *Caladiums* enjoy strong heat and a humid atmosphere with three daily syringings in sunny weather, but in dull days the usual damping of walls, &c., will be sufficient, otherwise attenuated leaf-stalks will result.

For ordinary purposes bottom-heat to start them is quite unnecessary, but a light position near the glass is of more importance, and is at all times essential. The plants in summer, before being removed to cool houses, should be hardened for a week in a less warm house than the stove, otherwise much of their beauty will go before they get used to the change.

Amongst the best varieties in cultivation I may mention Baron James de Rothschild, which has bright rose-coloured young leaves, which get paler with age; Madame Joubert Koechlin, long leaves, with fine large dark-red spots; Bosphore, very large leaves suffused with red; Luddemann, primary nerves crimson, the leaf blotched with magenta and white, and furnished with a light green border; Mitridates, leaves of crinsum-like, with darker venation, and bronzy green margin; Titian, a leaf, having finely reticulated red and green ground colour, with magenta midribs, a striking plant, especially when the leaves are young and still transparent; Aurora, orange-red, carmine leaf with a creamy-white margin—a very distinct plant; La Perle du Bresil, leaves white, suffused with rose, a green venation, and quite transparent; Cardinal, magnificent foliage, intensely red, spotted with yellow; Charlemagne, large, rose-coloured leaves, and dark red veins; Candium, one of the best whites, with deep green coloured venation; Duchesse de Montemart, large pure white transparent leaves; Comte de Germigny, lurid red, flaked with French grey, dwarf and distinct; Raymond Lemoine, a handsome thing, in crinsum and red, and very effective. Among older useful varieties, the pretty little *argyrites*, *Agrippine Demitry*, *Lepeschkiné*, *Souvenir* de Madame E. Audre, and Golden Queen, may be recommended.

KAMPERFIAS.

These plants succeed admirably when treated in a way similar to *Caladiums*, but as most of them are small-growing subjects, they are much easier accommodated as regards space. They belong to the Ginger family, and some are cultivated for their flowers, which are pretty while they last, but frequently both flowers and ornamental foliage are combined. The species most commonly met with are *Roseoana*, *rotunda*, *undulata*, *secunda*, *metallica*, *Parishii*, *Gilbertii*, and a few others—the last named a pretty little plant, throwing up a tuft of leaves about 6 inches high; they are oblong lanceolate, with slightly undulating margin, of a green colour, banded broadly with white, and irregularly striped with white lines—a distinct and desirable plant.

Monolophus elegans is a Maranta-like plant, with long-stalked, acute-lanceolate leaves, deep green above, purple beneath, with a broad central silvery band on the upper surface, the whole having a shining varnished appearance. It is a good decorative foliage plant.

Cienkowskia Kirkitii is a Zanzibar plant, with elliptic-lanceolate leaves and light rosy-purple blossoms, which are produced on many-flowered scapes; it is of easy cultivation, and succeeds under the same treatment as that afforded *Caladiums*, except that it should not be syringed when in flower, the latter being easily spoiled by moisture. Although *Cienkowskia* and *Monolophus* have now been included with *Kamperfiyas*, yet for garden purposes they are sufficiently distinct for the old names to be retained. *F. R.*

HOME CORRESPONDENCE.

THE WEATHER.—The very low temperature of 7° Fah. was recorded here this morning, March 4. This is the lowest reading since I have resided at Beckenham, from 1872. My thermometer is by Browning, and placed in a stand 4 feet from the ground, facing north. *C. S. Pringle, Farnley, Forge-road, Beckenham, Kent.*

—We have had during the last four nights severe weather for this time of year, the thermometer registered 8° and 9° of frost. This was exceeded on the 2nd, when the temperature was very low, and 15° being registered in the open, and 10° in the sheltered parts of the town. There was but little snow, only a slight fall of sleet on the 1st. Cold east winds have been prevalent for the last ten days, and I have observed that many of the choicer shrubs have suffered during the last few days, those which had made a new growth have all the points of the shoots destroyed. Many of the plants had commenced to grow freely, having experienced but little cold weather during the winter months. Many of the choicer *Rhododendrons*, *Veronicas*, and other *Enonymus* have suffered; most bulbs in the beds were coming into bloom freely, and have suffered from the cold and the cutting winds. Sweet Bays are grown largely in the sheltered parts of the town, and do not show any bad effects from the weather; but then these had made no new growths. I have observed that many of the choicer shrubs have a screen of latted wood, so placed as to protect them from the winds; they are most serviceable, and may be easily removed. *G. W., Bournemouth.*

—The sudden access of severe weather over these islands on March 3, brought on 22° of frost, an event of great infrequency at this time of the year, and the day before we had filled our ice-house, the two preceding frosts of 12° and 13° having given us an inch thick coating of ice on our ponds. Fortunately for vegetation a heavy fall of snow came previously and they were thus partially protected; but the poor *Apricot* trees have fared badly, as they were almost in full bloom, and a set of fruit would seem now to be an impossibility, although our best lot was heavily covered up. I fear we shall also see a deal of canker in the branches, as I am of opinion that frost, when the sap is moving, is the primary cause of this malady. *J. Sheppard, Woburn Park, Ipswich.*

—We registered here on the morning of March 4 as much as 28° of frost; and, strange to say, that on the same date last year the sharpest

frost of the season—24°—was registered. The Peaches, Apricots, and other wall fruits have suffered severely. *H. Turner, Fineshade Abbey Gardens, Stamford.*

—The thermometer this morning (March 4), at daybreak, registered 12°, or 20° below freezing-point, at 3 feet from ground. This is 6° lower than at any time during the present winter. *Thos. Woodford, Abberstone.*

EUCHARIS AMAZONICA.—We have a fine lot of plants of this popular subject, which have been flowering very freely since the end of November last year up to the present time, during which period liberal supplies of warm liquid manure, and an occasional dressing of artificial manure have been afforded them. I shall continue this treatment for a few weeks after the plants have done flowering, and afterwards they will then be kept on the dry side at the roots until a fresh batch of flower-spikes appear, when the treatment will be resumed. The plants are always kept in the stove. Treated in this manner, our plants are, as they have been during the last eighteen years, healthy, robust, and floriferous. With regard to the presence of the "mite" in the bulbs of *Eucharis*, I still entertain the opinion that in many instances the disease is brought about by the cultural treatment to which the plants have been subjected. Of this I feel quite certain, for I have known a batch of healthy plants to be infested with the "mite" nine months after they had changed hands. They had been kept too moist at the roots, and at too low a temperature. Plants, like animals, when badly treated in the matter of temperature, moisture, &c., are thereby predisposed to the attacks of disease, and in many cases the treatment generates the disease. *H. W. Wood.*

MEREWORTH CASTLE GARDENS.—I had, a few days ago, an opportunity of seeing these gardens, and could not but admire the thoroughness with which every operation is conducted, and the satisfactory state in which everything about them was. It was evident from all around that these gardens are at present managed by a gardener who knows how to make the most of the resources at his command. The fruit walls are covered with trees very well managed, and that are bristling with fruit-buds in the case of Apples, Pears, and Plums, and it was noticed that the long spurs so frequently seen on the trees were conspicuously absent here. Root-pruning and summer pinching is practised, and help to keep the trees in a healthy, fruitful condition. Peach trees on a long wall, planted about four years ago, are quite models of trained trees, having short-jointed and moderately strong shoots, carefully trained. Everything in the kitchen garden has been pushed on with speed, so that the ground is in good working order, and the sowing and planting of the various crops may go on when the weather breaks, without hindrance. I was much pleased with all that I saw there, and was satisfied that the sound practice advocated by Mr. Markham in his *Calendarial* articles in the *Gardeners' Chronicle* is carried out thoroughly at Mereworth. *H.*

CROCUS MINIMUS AND C. SUAVEOLENS

—In the beautiful rock garden of Andrew Kingsmill, Esq., at The Holt, Harrow Weald, patches of these two pretty Croci have been very attractive objects for a considerable time, despite the changeable and often inclement weather. The former, which have increased from cornus collected by Mr. Kingsmill in *Sergis*, display great variety of colouring, the inner segments of some being white, while those of others are light purple. *Crocus suaveolens*, whose portrait is among the drawings of Herbert's MSS. in the Lindley library, and which appears to have supplied the plate in *Bot. Mag.*, is an exquisitely pretty species, the blush outer segments delicately pencilled with purple and tinged with yellow at the base. Seen in patches of forty or fifty flowers, which are continually succeeded by others as they fade, and at a season when there is little else in flower outdoors, the charm of these pretty species may easily be imagined. *J. O.P.*

THE CULTURE OF LILIES.—Before adopting Mr. Wilson's plan of sinking casks in order to keep the roots of shrubs and trees from Lilies, I should like to know how long he has tried this plan, because my experience is to the effect that nothing is more likely to ensure the health of many species of Lilies than the presence of the roots of evergreen shrubs in the soil in which they grow. I attribute this to the fact that roots of other plants keep the soil from becoming

water-logged and sour at a time when the Lily roots are not active, and it is certainly the case that in nature Lilies, as far as I have seen them, grow more freely among shrubs and strog-growing herbaceous plants than elsewhere. Some species may at a time grow stronger if they are not exposed to the drying influence of other roots, but I have lost far more Lilies when I have planted them away from trees and shrubs than when they have been more or less smothered by them, and I do not think that it is wise to sacrifice the permanent well-being of Lilies for the sake of a temporary and unnatural luxuriance. *H. J. Elmer, Preston, Cirencester.*

FRAGRANCE IN FERNS.—In addition to those mentioned by Mr. Watson as noticed at Kew, there is *Cheilanthes fragrans*, and I have often noticed a very pleasing odour emitted by *Cheilanthes elegans*; while, on the other hand, there are some of the varieties of *Pteris* which have a strong scent that is very unpleasant, of the dead *Nettle*, *Pteris arguta*, and *P. sulcata*, are among those. *E. Sandford, The Gardens, Dale Park, Arundel.*

A CHEAP MUSHROOM-HOUSE.—A very useful and inexpensive house in which to grow Mushrooms was constructed by Mr. Beckett last autumn in the gardens of H. H. Gibbs, Esq., at Albenham House, Elm-tree. The idea was to utilise the warmth of the hot heap, which had inevitably to be made at the fall of the leaf. On the site which it was intended to use for the leaf heap, Mr. Beckett occupied spare labour in building a span-roof Mushroom-house of wooden slabs and boards, but as, if simply built one board thick, the slugs and wood-lice would come in through the openings and damage or destroy the crops; the house was constructed with double boarding, which was fixed on the inside and outside of the frame-work, and this admitted of a packing of 3 inches of coal-ashes between the inner and outer boards, which effectually excluded slugs and insects of all kinds. When the house was finished, the leaves were piled up around and over it, and soon a gentle heat was got up which has kept up evenly in all weathers. In due time the beds were spawned with mill-track spawn, and throughout December, January, and February there was a constant and regular succession of good Mushrooms, with plenty to run for a long time yet. Indeed, by spawning the beds in rotation the supply will not fail. Seeing the expense many incur for elaborately fitted Mushroom-houses, and the trouble they take to obtain what is often a poor and uncertain crop, this note on a structure in which the Mushrooms will grow with the least amount of attention on the part of the gardener, will be useful. Where leaves are not obtainable, stable litter would, no doubt, answer as well. A fine crop of *Rhubarb* is also to be found in Mr. Beckett's homely structure. *J. O.P.*

SEDUM ACRE AUREUM.—I am somewhat afraid that with the flow of the popular tide in favour of *Carnations*, *Chrysanthemums*, *Begonias*, and other things that are now such common favourites, many simple plants of great beauty and usefulness are in danger of becoming neglected and quite forgotten. One of these is the pretty Stonecrop at the head of this paragraph. Now that winter is dissolving into spring, this useful *Sedum* becomes tipped with the brightest gold, and on walls, rockwork, and other fitting spots, where it does not usurp the place of other plants, it shines forth with a radiance peculiarly its own. Singular to state, it seldom appears to blossom; the gold that in the green form appears in almost multitudinous flowers, here gives brilliancy to the foliage, and a dense mass of it becomes singularly attractive. Perhaps the rapidity with which it propagates itself causes it to be regarded as a kind of vegetable bore. *R. D.*

NANNY APPLE.—I was agreeably surprised, so recently as March 1, on taking down a small box which had been inadvertently placed close up under the tiles of an outhouse, to find in it a few very nice firm fruits of the Nanny Apple; they had been placed there since November last, and overlooked. The fruits were wrapped in tissue paper, and I was pleased to find how very soft and delicious eating they proved to be. I little imagined this Apple, which has the reputation of being a late autumn ripener, would have kept sound so long. Probably the cool and semi-damp nature of the place assisted to keep the fruits so sound and well-flavoured. The Nanny is probably one of the oldest of English Apples; its name bears the impress of age. I got the graft, from which the tree I have

grown, twenty-one years ago, from a huge tree reputedly one hundred years old, and as the kind is of so robust and enduring a nature, I have no doubt trees could be found in Sussex even much older than that. It is one of the kinds fought shy of by the express growers, who like to plant to-day and gather to-morrow, because it does not fruit much until it is well into years. It belongs to the Methastak tribe of the Apple family, full of bearing and vigour, when scores of others, having lived short and merry lives, have paid the debt of nature or are worthless. It comes into the category of great orchard trees, with Blenheim Pippin, Grange's Winter Pearmain, a very fine late Keeping Apple; Beauty of Kent, English Mother Apple, and some other fine kinds, which, when big and aged, are enormously productive. Fruits of the Nanny are of medium size, roundish, very slightly ribbed, eye somewhat depressed; skin, when ripe, rich golden hue, liberally flushed, and streaked with bright red. It is one of the prettiest, as it is one of the best flavoured of all our old Apples. *A. D.*

FORCED STRAWBERRY PLANTS.—When the crop has been taken from early forced Strawberry plants, they may, if wanted for forming a plantation, and for which they are not unsuitable, be hardened off in cool frames, keeping the lights closed for a few days, and then admitting plenty of air until the time of planting them out in the month of April. If early fruit is looked for, a warm border should be chosen, and the plants put out at 18 to 20 inches apart. In planting, the soil must be made firm about the ball, and the latter should be quite moist at the time. Short stable manure may be put between the plants to the thickness of 2 inches, and water given the plants to settle the soil about them. When well looked after, good crops of fruit may be obtained in the first autumn, following Elton Pine and Oxonian. *H. W. Ward.*

HEATHS AND CLAY.—In your note on Professor Goodale's article on the Heather failing to grow in America, you relate an experience of it having been grown on the London clay, with no peat, for many years; allow me to remark that you say *on London clay, not in it*; growing it on clay would give it a cool, moist basis, which is an advantage, by preventing drought from affecting it, and the assistance it received from the application of road sand supplied the silicates and humus required by Heather for its support; an example of Heather found growing in London clay pure and simple would be more conclusive. The plant is growing in London clay, generally sodden with water, and had only one application of road sand at the time of planting, say, ten years ago, &c. Let me relate a somewhat similar circumstance and its explanation. It was reported to me that a patch of Heather had been found growing on the limestone hills south of Bellovo, and one day, accompanied by my informant, I rode over a considerable extent of ground in quest of this eccentric Heath, which had exhibited so great a departure in the matter of taste from its family. I found the Heath growing, and not unhealthy, and its occurrence even on limestone was soon explained on a patch of undrained land, undisturbed probably for centuries, on which grass, rushes, and mosses had grown and decayed, leaving annually a deposit of decomposed vegetable matter, until a bed of vegetable mould resembling peat had accumulated; sweeping winds had brought particles of sand, and so contributed the other component of peat required by the Heath family. A little close investigation will often help to elucidate what appears anomalous. I have another record on a larger scale of peat-loving plants growing on what might be said was limestone. On the lower slopes of the Dent du Midi, at the upper end of the Lake of Geneva, Polygala Chamæchubus occurs abundantly, and on examination it will be found that the decay of vegetable matters has given a deposit of leaf-mould of a peaty nature, and of a depth sufficient to sustain the Polygala and the Ericas associated with it. In cultivation we regard Polygala as a peat-loving plant; my observation confirms Mr. Woodall's remarks on the same subject. *W. Ingram, Belvoir.*

SNOWDROPS IN ISLAY.—Snowdrops were in flower on this island on Christmas Day, and on New Year's Day the Lent Lilies were well above ground, with flower-stems one or two inches above ground also. I wish some capitalist gardener could be induced to come to this place; it might be to Scotland what the Scilly Isles are to England. Even in the eye of the wind Snowdrops were in bloom on

December 31, and the Lilies were hanging their heads preparatory to bursting into bloom. Honey-suckle is in full leaf against the house, and this in the rhins of Islay, where there is scarcely a shrub to be seen for miles—an open, rich alluvial country, with the ocean everywhere, and a stretch of Irish land in sight, from Katinlin to Instrebull. Thermometer to-day 80° in the sun, 62° in the immediate shade. *T. S. Colville, Islay.*

MULCHING.—Peas and Broad Beans, which have recently been transplanted from pots and boxes to warm borders and more exposed parts of the garden, should have a mulching of short dung laid on each side the rows of plants. This, in addition to keeping the soil about the roots of the plants warm and moist, will also shield the haulm from frost and injurious winds, and thereby increase the crop and extend its bearing period. *H. W. W.*

CINERARIAS AT GREAT DOODS.—A fine batch of plants is just now a very conspicuous feature in these gardens—and well exemplifies the state of perfection to which the florists have brought this flower. A dwarf plant of compact habit has long been familiar to us, and recently very large flowers of great substance, regular form, and often with a broad, well defined central ring of white. In many of the large-flowered strains the head of flower is not so full and compact as might be wished, and sometimes the edges of the leaves curve upwards. In Mr. Brown's strain all these defects seem to have been got over in a great measure, and the plants have a compact full head of bloom that is thrown well above the foliage; the individual flowers are large and of good substance, of varied shades of bluish-purple, carmine, magenta, &c., and often furnished with the white zone before mentioned. But in some of the plants, this zone or ring is produced in a rather different manner to what is usual; the petals being of a dark purple—with a ring of rosy-carmine instead of white, the flowers thereby gaining in distinctness. Should this break become general, or extend to other colours, we shall then possess a very distinct strain of the Cineraria. From what has been said, it will be seen that the strain is already distinct in these points, and the foliage is larger and of better substance than in others, and it is without the objectionable upturned edges, and hangs well over the edge of the pot—an undoubted advantage in plants employed in decoration. Although the pots in which the plants are grown are small ones, it is astonishing what satisfactory results are attained by judiciously assisting the plants with liquid manure. *F. R.*

PLAGIOLIRION HORSMANNI.—Do I understand that Plagiolirion Horsmanni is planted out in the open ground at Messrs. Sanders? If so, the plant of it which I have has been kept in much too hot a house, which no doubt accounts for its being far from as vigorous as you describe it to be at Messrs. Sanders. I should like much to know whether it is really hardy, or how much protection it requires. *C. W. Strickland.*

CYPRIPEDIUM CALLOSUM.—In the paragraph at p. 185, referred to by Mr. H. J. Ross on p. 264, "barbatum" was inserted instead of "Lawrenceanum," which was intended. If his *C. callosum* has hairy warts on both edges of the petals (not sepals as he states), it is an exceptional variety, and another proof that probably several of this section, which are considered distinct species, are local forms or modifications of *C. barbatum*, which in *C. barbatum pulcherrimum* so closely approaches a small form of *C. callosum* as to deceive a good judge at a short distance. On the other hand, the large dorsal sepal of *C. callosum* more nearly approaches that of *C. Lawrenceanum*, and apparently in Mr. Ross's plant having the petals clothed with hairy warts on both edges, it takes another step towards that species. *J. O'R.*

TRAINED SPECIMEN CHRYSANTHEMUMS.—A South-eastern Flat Trainer seems to have taken a somewhat one-sided view of my remarks on p. 630, vol. vi, due probably to his adopting the flat system of training himself. All that I intended to convey was that third-class workmanship is not deserving first-class pay. Not being an exhibitor at Kingston, I had no other motive than to call attention to an unmistakably badly trained lot of plants, and which I looked at again and again, wondering why they had been awarded 1st prize. I also spoke to several gentlemen present, and learnt that many others had been trying to solve the same problem. It may be

satisfaction to your correspondent to know this, and surely judges even at Chrysanthemum shows are liable to err at times. One exhibitor told me he had never seen a worse lot at Kingston than those to which my remarks applied, and I certainly never have myself. Therefore I contend that the judges would have been within the exercise of their prerogative had they, in this instance, withheld the 1st prize and awarded the 2nd—a very simple matter, for if memory serves me right, there was only one group in the class referred to; and the fact of judges withholding prizes absolutely, where the exhibits are not deserving award, is certainly nothing new. I am not aware that I have suggested training without staking; this is absurd. What I distinctly object to in trained specimens is, that there shall be more sticks and cross-stems in full view than anything else—a state of things rendered more displeasing from the fact that many of the finalities had been done so recently, that much of the foliage was on exhibition the wrong way up, and surely a good trainer of specimen Chrysanthemums would never permit this. *E. Jenkins.*

LA GROSSE SUCREE STRAWBERRY.—I have again to record my favourable experience with this excellent Strawberry as a first early forcer, and contend that it has no rival, being better in all points than Vicomtesse Hericart de Thury, Noble, Pauline, and King of the Earlies, each of which it has honestly beaten by nearly a week, and under equal circumstances and conditions, and was ripe on February 22. La Grosse has a stronger constitution than the above-named varieties, in standing forcing better, in freedom of flowering, and puts up stout flower stalks, followed by much larger fruit, and which swell away vigorously from the first; lastly, the fruit is firm, and packs and bears carriage to long distances by railway without injury. I have heard the flavour of La Grosse abused, but in February Strawberries I will waive that; but I cannot admit its accuracy, nevertheless. Noble will probably be tried again, but it takes a week longer to ripen than La Grosse Sucree, and the fruit is softer. Hericart de Thury is small and sweet, and only a few days later than La Grosse Sucree, but we cannot get the trusses out sufficiently far over the sides of pot, Pauline does not set its fruits properly, consequently they come deformed. King of the Earlies is a weakly grower, Black Prince subject to mildew, and Keen's Seedling is a bad traveller. Henceforth, La Grosse Sucree and President will be our mainstays for first and midseason forcing Strawberries. *W. Cropp, Malpasfield Canal, Malvern.*

SINKING TUBS FOR PLANTS.—Those who have to contend with the difficulties in horticultural practice that are found in places where soils little suited to plant culture exist, will best appreciate Mr. G. F. Wilson's idea of isolating particular plants or bulbs by sinking tubs filled with the preparation of soil their distinct occupants require, and thus securing them from the invasion of more vigorous and encroaching associates either in the border or shrub-beries. It occurs to me that in that way Rhododendrons and other American plants may be grown in limestone districts. Many attempts in such localities have been made by excavating holes, and filling them with peat, but hitherto failure has generally attended such experiments. Heavy rains, by carrying the lime-charged water to the beds, and a too porous subsoil, having greatly contributed to it. If Mr. Wilson finds the plan advantageous, possessing, as he does, deep beds of Peat and a light siliceous soil, the delight of Lilies, as the stalks crowned with bloom that tower above one's head at Wisley sufficiently testify, how much more valuable we may expect it to prove in situations where clay, more or less calcareous, prevails, for even in such positions pockets of peat soil are soon deteriorated by means of worms and invading roots. I have, by way of experiment, employed the barrels in which American Apples are imported; these filled with to us—the precious commodity peat, and other preparations, when necessary, for Lilies, and sunk amongst shrubs, lead me to look forward hopefully to some degree of success hitherto unobtainable in their culture. *W. Ingram, Belvoir.*

THE JOS FLOWER of the Chinese has received considerable attention in England this winter, although I fear some amateurs have been disappointed when their plants flowered; they having thought that it would prove to be something more than an ordinary Narcissus, and be that as it may, it still remains a desirable plant, especially as it stands

forcing, and flowers freely. The method in which it may be grown will have a charm to many, and perhaps next season the bulbs will be somewhat cheaper than they were advertised this past season. We put in three bulbs of Narcissus Tazetta, but of what variety I do not know, but they were good large bulbs, and while the Jos flower has been flowering for some time past, these are only some 4 inches in height, though they have received the same treatment, and were planted at exactly the same time. W. Harrow, *Botanic Garden, Cambridge.*

THE APIARY.

BEE-KEEPING AS AN OCCUPATION FOR WOMEN.

The following, though it comes over the great herring pond, from the *American Bee Journal*, is very applicable to our country:—
The question may be, and no doubt often has been, asked, "Is bee-keeping a suitable or desirable occupation for women?" and after having given it a fair trial (says Henrietta F. Buller) for the last eight years, I am of the opinion that there is no reason why any woman of moderate strength and ordinary intelligence should not be able to take charge of an apiary of from thirty to fifty colonies with very little assistance, and derive both pleasure and profit from the employment. At the same time I doubt whether there are many who would succeed very well in carrying on the business alone, though of course there are a few who would.

In reading the numerous bee papers that are published nowadays, one frequently meets with articles on the subject of whether it is best to make a speciality of bee-keeping, or combine it with some other occupation. Now, I do not believe that the farmer can himself carry on both farming and bee-keeping successfully, but if he has either daughters or sons who will make a speciality of this department—bee-keeping—it may be very advantageously combined with farming, and I do not know of any reason why girls might not make as great a success of the business as boys. The wife is supposed to have her hands quite full enough with household work, and, I may say, her head too; and, for any one, either boy or girl, man or woman, to do any good with bees, they must give them their individual attention, and be really interested and enthusiastic over their work. "Eternal vigilance is the price of success" in any business, and in none more than in bee-keeping. It is not only a labour, but a science, and will make constant demands not only on the patience but on the bodily strength and intelligence of those who engage in it; at the same time, there is a fascination about the business which relieves it of all tediousness. A woman will think of her bees, study about them, and become so interested as to be almost pained for her work by the love of it.

I believe it would be well worth while for any one who has not been in the way of having the management of an apiary to spend one season with a skillful bee-keeper before embarking in the business on his own account, as he would then find out not only the best methods of working, but also whether the kind of work suited him. However, even with this preparation, all will not succeed; for I know a lady who took this course, and afterwards failed entirely when she was working for herself, while others who have only learned what they could from books and papers, besides the suggestions and instructions given them by more experienced bee-keeping friends, have done very well. In conclusion, I may say that a great deal of the work in the apiary is quite as well adapted for women as for men, and also in the care of the honey, and in preparing it for market. Where they are more likely to feel their deficiency is in the lack of skill to do the various carpentering jobs that seem to be inseparably connected with bee-keeping. I imagine that it is the exception rather than the rule to find a woman who knows how to handle carpenter's tools, though even this they may acquire enough of to answer the purpose where there is a necessity for so doing. *Bee.*

SOCIETIES.

THE SCOTISH HORTICULTURAL ASSOCIATION.

This Association held its thirteenth annual general meeting on the 4th inst, in 5, St. Andrew Square, Edinburgh, Mr. D. P. Laird, Vice-President, in the chair, the meeting being a crowded one. The Treasurer, Mr. A. Mackenzie, Warriston Nursery, read the financial report for the past year, which showed that the income was £33 7s. 10½d., and the expenditure £31 10s. 9½d., leaving a balance of £21 17s. 1½d. to the credit of the Association. The Secretary's report showed that the past year had been one of great prosperity, and that the influence and usefulness of the Association were steadily extending. Both reports were approved of, and cordial votes of thanks were accorded to the Secretary and Treasurer for their able services during the past year.

The election of office-bearers for the ensuing year then took place, as follows:—The Duke of Buccleuch and Queensberry, K.T., Hon. President; Professor Bayley Balfour, Secretary; Mr. Robertson Munro, Abercorn Nursery, and Mr. Carruthers, Hillwood, Corstorphine, Vice-Presidents; Mr. R. B. Ferguson, of Messrs. Munro & Ferguson, 6, South St. Andrew Street, Edinburgh, Secretary; and Mr. A. Mackenzie, Warriston Nursery, Edinburgh, Treasurer. In the room of five retiring members of Council, the following gentlemen were elected:—Messrs. D. P. Laird, Alex. Milne, P. W. Gray, John Methven, and Alex. Calder.

The chairman announced to the meeting that on the occasion of the first monthly meeting of the session (April 1) the Rev. G. Marjoribanks, of Stenton, would deliver a lecture to the members of the Association, the subject of the lecture being "A Trip Across the American Continent."

There were some interesting exhibits on the table. Mr. James Brown, The Gardens, Ayraroch, Dumbartonshire, was awarded a Cultural Certificate for two fine specimens of *Androsium* noble, each with about 150 blooms of very large size and splendid colour, and a grand plant of *D. Wardianum* with over 200 blooms. Mr. Alexander Chalmers, The Gardens, Terregles, Dumfries, exhibited an *Odontoglossum* of the crispum type, which was alleged to be "a natural hybrid," but which was decided to be an ordinary *O. crispum*. The spike of blooms was fine, the flowers were white with very slight markings.

Mr. Wm. Minty, The Gardens, Isle of Raasay, Stromeferry, exhibited a curious example of "sport" in a Dutch *Hyacinth*, the peculiarity of which was that two spikes of flowers grew from one bulb, each distinct from the other, not only in colour, but also in the shape and size of the flowers, and also in the build of the spikes; each was perfect in its way, and there was no evidence of fasciation. From the same exhibitor came some good blooms of *Rose Gloire de Dijon*, grown in the open air in Raasay, and also sprigs of *Fiens stipulata* from a north wall in the same place.

Messrs. Dickson & Co., Pulrig Nurseries, Edinburgh, exhibited blooms of the pretty *Cyrtanthus McKeanii*, and the curious *Gladiolus atroviolaceus*.

The several prizes offered by the Association for essays on various subjects by assistant gardeners, only drew out one essay—a miserable excuse—by the young gardeners of Scotland, in the course of a year. The solitary essay was by Mr. Alex. Munro, journeyman gardener at Powollis, Falkirk, the subject being, "The Best Method of Procuring a Supply of Cut Flowers all the Year round;" and the writer was awarded the usual Certificate of the Association.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending March 1st, is furnished from the Meteorological Office:—

"The weather during this week has varied considerably in different parts of the kingdom. At first it was rather mild and generally fair over Ireland and Scotland, and rather cold and dry, with local mists and fogs over England. Towards the end of the week it became cold and wintry in all districts, and slight falls of snow, alternating with bright intervals, were experienced over Great Britain, as well as in some parts of Ireland. In the

extreme south-east of England, however, the snowfall was considerable.

"The temperature has just equalled the mean in 'Scotland, E.' and 'Scotland, N.', but in all other districts it has been below the normal value. In 'England, S.W.' the deficit has been 5°, and in 'England, E.' and 'England, S.' as much as 6°. The highest of the maxima, which were registered during the earlier days of the period, ranged from 45° in 'England, E.' to 56° in 'England, S.W.' and to 60° in 'Scotland, E.' (at Ochtertyre). The lowest of the minima were recorded either on Friday or Saturday, where the thermometer fell to 20° in 'England, S.W.' 21° in 'Scotland, W.' and 'Scotland, E.' 22° in 'England, S.' and to between 23° and 25° in most other districts.

"The rainfall has been the same as the mean in 'England, N.E.' but in all other parts of the kingdom the fall has been less than the normal. In most districts the fall was extremely slight.

"Bright sunshine shows a very decided increase on that recorded during the previous week, the percentage of the possible duration having ranged from 17 in 'Scotland, N.' and 'Ireland, N.' to 31 in 'England, S.' 32 in 'Scotland, W.' and 'England, N.W.' 43 in 'England, S.W.' and to 58 in the Channel Islands."

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.	BRIGHT SUN.
	ACCUMULATED						
	Above (+) or below (-) the Mean for the Month of March 1.	Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since Jan. 1, 1890.	Below 42° difference from Mean since Jan. 1, 1890.

POTATOES.—Supply of old Potatoes continues plentiful, and the market has a tendency to fall. Fresh arrivals of Canary new potatoes; price from 1s. to 2s. 6d. Market quiet. Inferior samples doing well except at low rates. New Potatoes best samples quickly cleared at 2s. to 2 1/2d. each. J. B. Thomas.

SEEDS.

LONDON: March 5.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report to-day's market thinly attended. There is more inquiry for field seeds, and the very low prices all round now ruling in London prove very agreeable to buyers. Choice Red is obtainable at unprecedentedly cheap rates. Alsike and white firm. Trefoil steady, but quiet. Fine Rye-grasses could never before be bought at to-day's quotations. Rapeseed is inquired for. Birdseed sold slowly. There is more doing in Blue Peas.

CORN.

Average.—Official statement showing the average prices of British corn, imperial measure, in the week ended March 1: Wheat, 23s. 10d.; Barley, 30s. 11d.; Oats, 18s. 8d. For the corresponding period in 1889:—Wheat, 23s. 7d.; Barley, 29s. 1d.; Oats, 16s. 8d.

FRUITS AND VEGETABLES.

SPITALFIELDS: March 5.—The supplies exceed the demand as regards fresh vegetables and Potatoes. Fair supply of foreign fruit. Good demand. Prices were as follows:—Cauliflowers, 3s. to 4s. per tally; Savoys, 2s. to 4s. do.; Sprouting Broccoli, 1s. 6d. to 2s. per sack; do., 6d. per sieve; Turnips, 1s. to 1s. 6d. per sack; Spinach, 1s. per bushel; Curley Kale, 5d. to 9d. do.; Scallop, 1s. to 1s. 6d. per punnet; Greens, 1s. 6d. to 2s. 6d. per dozen bunches; Parsley, 2s. 6d. to 3s. do.; Carrots, 1s. 6d. to 2s. 6d. do.; Turnips, 2s. 6d. to 3s. do.; Parsnips, 4d. to 9d. per score; Beet-roots, 1d. to 6d. per dozen; Horse-radish, 1s. to 1s. 3d. per bundle; Celery, 4s. to 12s. per dozen bunches; Leeks, 1s. to 1s. 6d. per dozen; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Endive, 1s. 6d. to 2s. per bushel; English Onions, 10s. to 11s. per cwt.; Spanish do., 10s. to 12s. per barrel; Bordeaux do., 7s. to 8s. 6d. do.; Dutch do., 7s. to 8s. per bag of 110 lb.; Belgian do., 7s. to 8s. do.; English Apples, 5s. to 6s. per bushel; American do., 16s. to 26s. per barrel; Dates, 13s. per cwt.

STRATFORD: March 4.—Supply has been good during the past week, and a fair trade was done at the following prices:—Savoys, 4s. to 6s. per tally; Cauliflowers 5s. to 10s. per crate. Turnips, 30s. to 40s. per ton; Carrots (household), 38s. to 40s.

do.; do. (cattle feeding), 10s. to 22s. do.; Mangels, 14s. to 17s. do.; Swedes, 15s. to 18s. do.; Onions, English, 10s. to 12s. per cwt.; do., Dutch, 7s. to 8s. per bag; Apples, English, 3s. to 7s. per bushel; do., American, 18s. to 25s. per barrel; Celery, 4s. to 10s. per dozen rolls; Rhubarb, 1s. 9d. to 2s. per dozen bundles.

POTATOS.

BOROUGH AND SPITALFIELDS: March 4.—Quotations.—Regents, 40s. to 55s.; Hebrons, 40s. to 50s.; Magnums, black, 35s. to 50s.; Bedford, 40s. to 50s.; Lincoln, 40s. to 60s.; Yorks, 45s. to 70s.; Scotch, 50s. to 95s.; Imperators, 40s. to 70s. per ton.

SPITALFIELDS: March 5.—Quotations.—Hebrons, 40s. to 65s.; Imperators, 45s. to 65s.; Magnums, 40s. to 50s.; Regents, 50s. to 60s.; Champions, 40s. to 50s. per ton.

STRATFORD: March 4.—Quotations.—Scotch Regents, 55s. to 65s.; do. Magnums, 60s. to 70s.; English Regents, 50s. to 60s.; Light English Magnums, 40s. to 55s.; dark do., 35s. to 40s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 75s. to 85s.; inferior do., 46s. to 75s.; hay, best, 60s. to 85s.; inferior do., 25s. to 50s.; and straw, 25s. to 35s. per load.

Obituary.

We announce with regret the death, at the age of sixty-eight years, of Joseph May, after a short illness, on the 20th ult. The deceased was for many years well known in Covent Garden Market, and was for the last twenty years in the service of Messrs. John Waterer & Sons, Bugshot, Surrey. He was an occasional contributor to these pages.

NOTICES TO CORRESPONDENTS.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

AGENCY FOR THE DISPOSAL OF CHOICE FRUIT AND FLOWERS: B. P. We know of no such agency. There are "direct supply associations" of various kinds, but how these differ from the much abused commission agent, we have not discovered.

BAMBOO ROBS: D. E. We must decline to recommend tradesmen. Advertise your wants, or examine the *Garden Directory*, under the heading, "Horticultural Sandresmen."

BOOKS.—ARTIFICIAL HEATING AND VENTILATION: *W. H. A practical treatise on Warming Buildings by Hot Water, Steam, and Hot Air, and on Ventilating*, by Chas. Hoad. Published by Messrs. Sampkin, Marshall & Co., and Messrs. Spott, London.—ON FARMING, SCIENTIFIC AND PRACTICAL: *H. B. The Book of the Farm*, by Hy. Stephens, fourth edition, revised and in part re-written by J. Macdonald. There will be of this edition six parts, of which four have already been issued. W. Blackwood & Sons, Edinburgh and London. We do not know the price. Publishers should advertise.—*DR. HOGG'S "FRUIT MANUAL"* R. S. D. It is published at the office of the *Journal of Horticulture*, 171, Fleet Street, London, E.C.—MANUAL ON GARDENING: *A. B. C. The Garden Calendar*, by T. W. Sanders, price 3s.; published by Hamilton, Adams & Co., Paternoster Row, London.—LONDON PARKS AND GARDENS: *A. Beck. The Royal Parks and Gardens of London*, by Nathan Cole, published at the *Journal of Horticulture* Office, 171, Fleet Street, E.C.

CATTLEA TRIANGLE. T. E. I. The narrow-lipped form which collectors avoid. Its colour is fine and there is a bare possibility that it may improve

in form; 2, is a good variety of the broad-lipped and large-petalled form.

CORRECTIONS.—CYPERIDIUM SPICERIANUM. A mistake was made in describing at p. 261 the plant figured in our Supplementary Sheet. The plant was not growing in a 60-size pot when, as was stated, the photograph was taken, but when it first came into Mr. Coomber's hands some few years ago.—On p. 270 of last week's issue read "dark heud Heather" instead of "dark lurid Heather" at line 37 in "Lamington and its late Lord."

EUCHARIS: *U. (Raphy)*. Your plants of Eucharis are attacked by a fungus, described with illustrations in our issue for March 27, 1886, p. 336.

LEAVES OF INDOOR PLANTS: *J. M. S.* The leaves are spotted with abundance of loosely deposited spores. They are merely on the leaf, and not (in their present condition) parasitic. They look so like the conidia of one of the Sclerotinias, however, that we should be inclined to suspect them of parasitic habits in some seasons and places. They might be got rid of by washing. Surely, if they are merely scattered through the greenhouse, the fungus whence they spring should be discovered. Next time they are freshly formed, kindly send one or two lots direct to Prof. H. Marshall Ward, Forestry School, Cooper's Hill, Staines.

MUSHROOMS IN RAILWAY ANCIES: *Business*. We think you estimate the manure at rather too high a figure, as also the spawn, as, by taking 100 bushels, you ought to be able to get it at a cheaper rate than 3s. 6d. per bushel; or, better still, make it yourself. The price, 6d. per pound, is, taking the year's prices, much too low. We have known Mushrooms in winter fetch 20s. to 30s. per bushel. If the ends up, artificial heating would be required. It will be necessary for you to find out other markets besides those in London where the produce may be disposed of to advantage.

NAMES OF PLANTS: *G. S.* 1, *Selaginella viticulosa*; 2, *Pteristrophe speciosa* (= *Justicia*); 3, *Linum Trigatum*; 4, *Cissus amazonica*; 5, *Eranthemum uticum*.—*Hortus*. *Leptospermum bullatum*. Your *Azaleas* and *Crotone*s are attacked by thrips. —*T. C.* *Iris imbricata*.—*Eversfield*. 1, *Dendroium Pierardii*; 2, *Vanda coarulescens*.—*Quarndon*. 1, *Acacia dealbata*; 2, *Cianthus* (probably *C. panicus*); 3, *Doronicum caucasicum*. Grow in pots, and protect in a cold frame till December, then remove to the greenhouse.—*H. Smith*. Specimen insufficient.—*H. C.* 1, *Polyporus fraxineus*; 2, *Corticium giganteum*; 3, *Polystictus versicolor*; 4, *Only spaw*; 5, *Polyporus annosus*; 6, *Peltidea canina* (lichen). There is no such book as you mention. *M. C. C.* — *H. S.* *Ficus stipulata*, an almost hairy species.

ORCHIS LONGIBRACTEATA: *Monaco*. Fine specimens, but we have no doubt, as in the case of *O. foliosa*, it would improve under appropriate cultivation.

PLUM STOCKS: *C. J. X.* The St. Julien and Black Damask *Cl. Stocks* are practically the same, although samples of both sometimes vary slightly in appearance, owing to the soil on which they have been grown. Seeds are also sown under both names, and then the individuals of both will differ slightly among themselves.

ENTED HORTICULTURAL BENEFIT AND PRESIDENT SOCIETY: *H. L.* The address of Mr. Collins, the Secretary of the above, is 9, Martindale Road, Balham, S.W.

VINES. *H. W. G.* The injury to your Vines is due to some chill, or sudden alteration of the temperature.

Nicotine Soap.

AN Unrivalled INSECTICIDE for the use of Plant Cultivators, being an effectual ERADICATOR of SCALE, THRIPS, GREEN FLY, MEALY BUG, and ALL PARASITES affecting PLANTS, WITHOUT INJURY TO FOLIAGE. It has now undergone a thorough test by some of the most practical men in Horticulture, and it is proved, beyond all doubt, that no Insecticide will bear comparison with it for its deadly effect on Insects, combined with perfect safety to the Plants themselves.

Some hundreds of Testimonials lately received from men of considerable experience throughout the Kingdom.

Sold in Jars, 18. 6d. and 3s.; in Tins, 15s. 6d.; and in Drums, 28 lb., 25s.; 56 lb., 50s.; 112 lb., 95s.

Full directions for use upon each Package.

 AGENTS WANTED—AGENTS WANTED.

MESSINGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouses, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames, also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of which shows, therefore, building the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSINGER & COMPANY, LOUGHBOROUGH.

SANKEY'S GARDEN POTS

Are used by the leading Horticulturists and largest Nurseries in the World, and acknowledged by all to be the lightest, strongest, best colored, most perfect shaped and finished pots ever manufactured.

MARKET POTS,

or Long Tons, are largely used by Market Growers—they are made a greater depth, wider at bottom, and are half an inch in width at top over ordinary pots. Have no rims.

VINE POTS

Are used by the leading Vine Growers throughout the kingdom, and pronounced unequalled for Your Culture.

CHRYSANTHEMUM POTS.

Especially deeper than ordinary, very broad at bottom, almost straight on top, do not blow over when outside, like narrow bottomed pots; give maximum amount of room for nutriment at roots of plants.

CLEMATIS POTS.

OPINION.—Your pots are light and strong, first-class in color, shape, and finish. The "Clematis Pots" give unqualified satisfaction to ourselves and customers.—Messrs. Wood & Ingram, Huntingdon.

ROSE POTS.

OPINION.—We beg to say that we are highly satisfied with your Garden Pots, they are well made, light, yet strong, and we like them better than any others we have ever used.—Messrs. Richard Smith & Co., Nurseries, Worcester.

The Flower Pots we have largely supplied us with are light, strong, and well made, and in every respect highly satisfactory.—Messrs. Dicksons Ltd., Chester.

For nearly thirty years I have been using your garden Pots, and still find them the best and cheapest.—Mr. William Bull, Chelsea.

We have always found your Pots highly satisfactory. Great improvements last few years in them.—Messrs. Pearson & Sons, Chilwell Nurseries, Notts.

Samples and Prices free. Carriage and breakage free on £10. Half carriage on £5. Specialty Orchid Pans and Pots.

SANKEY & SON,
BULWELL POTTERIES, NOTTINGHAM.

New Pattern Tree Guard, "THE PORCUPINE."

The maximum of utility at the
minimum of cost. Constructed of
strong Iron Uprights and Galvanised
Barbed Steel Wire.
Price, 10s. 6d. each.
THE PATENT
The Gardens, The Whittern,
Kingston, Feb. 9, 1888.
Dear Sirs,—The 100 Barbed Wire
Tree Protectors you sent to Mr.
Green's order I have now fixed to
the trees, and I feel bound to say
that I never saw anything in the
shape of a tree protector equal to
them. I think I shall be able to
add further testimony after the
cattle are turned out in the spring.
—Yours faithfully, J. WEARING.
The Gardens, The Whittern,
Kingston, Sept. 26, 1888.
Gentlemen,—The 100 Porcupine
Tree Guards you suggested to Mr.
Green's order have proved a great
success—in fact, they are the best I
ever saw. These guards stand well
against the trees, therefore
cattle cannot, and
will not, attempt to
reach the branches. I
would strongly recom-
mend anyone who cut im-
plies planting trees, and
wishes to know which is
the best guard to use, to
give pattern "C" a trial.
—Yours faithfully,
J. WEARING.

"OUR HARDY FRUITS."

A Practical Guide to their Cultivation. For Landowners, Tenant Farmers, Cottagers, and Allotment Holders. By BRIAN WYNNE FRIS, Editor of the Gardening World. EYLE and SPOTTISWOODE, Sale Office for Government Publications, East Harding Street, London, E.C.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD," ESTABLISHED 1791.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Estates.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charges.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates. Apply for terms. SPECIMENS FREE. Price 2d. Published Friday for Saturday.

OFFICES:—72, HIGH STREET, WORCESTER.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, it cannot be made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

B. S. WILLIAMS and SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMEN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

Gardeners, Foresters, Land Stewards. R. B. LAIRD and SONS can recommend with every confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, SEWARD, BAILIFFS, or GARDENERS.

JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 239, High Holborn, W.C.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—JOHN DOWNE, Seedman, 141, Princes Street, Edinburgh.

Gardeners, Foresters, and Farm Bailiffs. LITTLE and BALLANTYNE, The Queen's Nurseryman and Seedsmen, Carlisle, invite correspondence with Landlord Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, or FARM BAILIFFS. Their extensive business relations throughout the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentlemen with particulars. See—St. John's Nurseries, Worcester.

KNOX GARDENERS.—At the present time I can recommend several highly respectable MEN, of known ability and first-class character.—F. OS, BUTCHER, Seed Merchant, Croyston.

Gardeners, Farm Bailiffs, Foresters, &c.

DICKSON'S Royal Nurseries, Chester, (Lancashire), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

GARDENER (HEAD).—Age 31; thoroughly experienced.—HEAD GARDENER, Cowshed House, Salisbury.

GARDENER (HEAD).—Can be highly recommended by W. C. LEACH, Albany Park Gardens, Goldford.

GARDENER (HEAD), where one or two are kept.—Age 25, experienced in all branches, seven years in present situation. Good character.—E. CRAPP, Curzonton, St. Columba, Cornwall.

GARDENER (HEAD).—Wide practical experience in all departments at home and in the Colonies. Highest references.—R. W., Bryn-Magwyn, Llanfair, Llanidno.

GARDENER (HEAD).—Age 30, married, in a family; thoroughly understanding of Stocks and Horticulture, Fruit, and Vegetables.—A. H., The Lodge, Bishopcleeve, Hillingdon, Middlesex.

GARDENER (HEAD).—Age 28, married; fourteen years' experience in good establishments in all branches. First-class references.—G. W. D., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD).—Married; eighteen years' thorough practical experience in the Cultivation of Vines, Peaches, &c., Flower and Kitchen Garden. Abstainer. Excellent character.—F. H., Millman Street, Chelsea, S.W.

GARDENER (HEAD), where two or three others are kept.—Understands Vines, Peaches, Nectarines, Melons, Cucumbers, Stoves, Greenhouses, Kitchen and Flower gardens.—H. COX, Perceval Hill, Chesham.

To FLORISTS.—A young Lady, age 24, seeks situation. Good references, and experienced in all its branches.—E. T., High Road, Chiswick, London.

HOLLOWAY'S PILLS.—Nervousness and want of Energy.—When first the nerves feel unstrung, and listless sense supplants energy, it is the right time to take some active agent as Holloway's Pills to prevent disorder running into disease. These excellent Pills correct all irregularities and weaknesses. They act so kindly, yet so energetically on the functions of digestion and assimilation, that the whole body is revived, the blood is renewed richer and purer, the muscles become firmer and stronger, and the nervous and absorbent systems are invigorated. These Pills are suitable for all sexes and all ages. They have most marvellous effect on persons who are out of condition; they soon rectify whatever is in fault, restore strength to the body and conduct to the mind.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1890.

The Winners of every Highest Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS, THE EMPEROR OF RUSSIA,
The Late EMPEROR OF THE FRENCH, The EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 155,000 of these Machines have been Sold since they were first introduced in the year 1856.

And thousands of unimpaired Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

- The following are their Advantages over all others:—
- 1st. Simplicity of Construction—every part being easily accessible.
 - 2nd. They are worked with much greater ease than any other.
 - 3rd. They are the least liable to get out of order.
 - 4th. They make little or no noise in working.
 - 5th. They will cut either short or long Grass, wet or dry.

DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man on even lawn	£4 10 0	To cut 22 inches, can be worked by two men	£8 10 0
To cut 18 inches, do. man and boy	7 10 0	To cut 24 inches, do.	9 0 0
To cut 20 inches, do.	8 0 0		

These Mowers are the "No Plus Ultra" and "Acme" or perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Feeding Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY AND PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

Friday, March 21.

From Messrs. F. Sander & Co., St. Albans, CATTLEYA IMPERIALIS and others. Specially fine importation, enormous masses.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, March 21, at half past 12 o'clock, a splendid specimen of the superb variety of years ago. The present consignment has been sent by one of our oldest collectors, Mr. Bartholomew, and the plants are raised in and we recommend buyers to carefully inspect the plants offered, as we believe many of the specimens are super, or a type of that magnificent Cattleya. We have now imported Cattleyas for twenty years, but have seldom seen such fine plants as those now offered. We present a large sum of money in getting the consignment of this the finest Cattleya in the section. It is absolutely a fact that the white stripes came from the same locality (See last number of Beechenbachia).

On view morning of Sale, and Catalogues had.

Friday Next.

VANDA CERULEA, and a lot of Established Plants. MESSRS. PROTHEROE AND MORRIS are instructed to include in their SALE, on FRIDAY NEXT, March 21, a magnificent lot of the above-named ORCHIDS, consisting of about 35 plants in large pans, all in splendid health and condition.

March 21, a magnificent lot of the above-named ORCHIDS, consisting of about 35 plants in large pans, all in splendid health and condition. There is also a splendid specimen of LÆLIA PURPURATA, of 53 BULBS and 9 FLOWER-SPEATHS, and specimen CATTLEYA MENDELLI, with 60 Bulbs and 12 Flower-sheaths.

Friday Next.

ODONTOGLOSSUM (New Hybrid). MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. F. Sander, St. Albans, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, March 21, a magnificent lot of the above-named ODOGLOSSIM, between Pescatore and triumphans, absolutely distinct from anything hitherto seen, and exquisitely charming; Sir Trevor Lawrence's, the known Knox's variety and Excellens in it is the way to the flower, a large, dark crimson, which plants were from our importation; but the variety now offered is different to either, and takes rank with the princes of this class. It is a large, round, white and yellow ground, with numerous small and large, round, white and yellow ground.

We offer this plant entire, consisting of four bulbs and two new growths; it is a double plant with 11 leaves, and within a few weeks will divide into two. The plant carries a spike of five flowers.

May be viewed on the morning of Sale, and Catalogues had.

Tuesday, April 1st.

KELWAY'S GOLD MEDAL (PARK) SPECIALTIES. GLADIOLI, PEONIES, PYRETHRUMS, GAILLARDIAS, DELPHINIUMS, &c. CATALOGUES and lists of seed-free, containing Priced and Descriptive Lists of all our Specialties for 1890, and everything useful for the Gardener.

THE BEST MUSHROOM SPAWN "DICKSONS IMPROVED." 5-pence per Cucumber, 4-pence per Pot Free. "DICKSONS" Seed Merchants, and Seed Free, CHESTER.

SEAKALE. Very Low Prices for Cash. 2nd size, Foreign, 2s. per 100; 1st size, 100s. per 1000. Good Planting size, 1s. per 100; 20s. per 1000.

ASPARAGUS. Strong, healthy, 2-year roots, 2s. 6d. per 100; 20s. per 1000. S. G. RUMSEY, Nurseryman, Wrotham, Kent.

Come and See. H. CANNELL & SONS, SWANLEY, KENT. Our CINCERARIAS, the finest collection in the world. The Royal Horticultural Society at their last meeting, awarded twenty-four Plants the highest Honour.

ARECA LUTESCENS, Trade Offer. 60's, 2 1/2 inches, five and six leaves, 75s. per 100. COCOON, WIDE BELLE LINA, 90's, 75s. and 100s. per 100; ditto, 9 inches, 25s. per 100.

CLIBRAN'S BEAUTIFUL FERNS for Greenhouse or Table Decoration.—12 lovely sorts, 4s. 6d., and 9s. Clibran's Palms, best varieties, small, 6s. per doz.; larger, 12s., 18s., and 24s. per doz. CATALOGUE, 100 pages, three stamps.

SMALL SIRUBS, &c., Reduced.—Araucaria imbricata, 10 inches, 40s. per 100; Sweet Bays, 2 yr., 25s. per 100; Cupressus macrocarpa, 9 to 10-inch tops, 5s. per 100.

SEED POTATOS, Reduced.—A few tons of Myatt's and Rivers' Kidney Potatoes, 4 1/2 per ton, good quality. GARLES MITCHELL, Nurseryman, Stranraer.

STRAWBERRY RUNNERS for cash with order, Paxton, 7s. 6d. per 1000; 1s. per 100. B. Queen, 15s. 6d., Noble, 10s. 6d. per 100 extra carriage paid.

BAIRN'S Descriptive LIST OF VEGETABLE and FLOWER SEEDS, free.—Full of useful information. SELECTIONS OF VEGETABLE SEEDS, 12s. 6d., 21s., 31s., 6d., 42s., 63s. and upwards.

EXTRA LARGE PALMS 25-SEAPORT for Winter Gardens, &c. From 12 to 20 feet. 10 ARCA LUTEA and A. BAUERII, 12 to 15 feet high, with 10 KENTIA BELMORIANA, 10 to 12 feet high, with 19 C. FOSTERIANA, 10 to 12 feet high, with 20 C. BELMORIANA and PLUMOSA, &c.

TO THE TRADE.—JERUSALEM ARTICHOKEs and STAGHYS TRIBERRIFERA, a fine stock grown by ourselves. Lowest price application to JAMES WATSON, 487, 479, and 295, High Holborn, London, W.C.

SEED POTATOS.—Any and all in London. Prices, 5s.; Myatt's, 40s.; Beauty of Helbron, 5s.; Best of All, 6s.; Early Regents, 40s.; Reading Giant, 60s.; and every sort cheap. Low rates for quantity. I will not be undersold by any 2s. per bushel firm.

SPECIAL OFFER.—ODONTOGLOSSUM 20 RUSSII MAJAS, in 12-inch pots, 5s. each, five for 41; 5-inch pots, 3s. each, five for 12; 4-inch pots, 2s. each, six for 10s. Twelve for 10s. Cash and packing free. Strong established healthy plants, worth double. Competition not allowed.

SPECIAL OFFER.—LILIUM KRAMERI (Punk Lily), fine stock, July 1, 1s. 6d., and 9s. per dozen, richly low prices. L. MACRANTHUM, a lovely Lily, 2s. each, 20s. per dozen—fine for exhibition. Special LILY LIST free on application. Thirty varieties on offer.

FOR SALE, 10,000 GENISTAS, in 3-inch pots, at 7s. per 100; 250 Stone-pots, 10 to 12 inches, with 1000 Genista, at 2s. 6d. per 100. Cash with Order. T. BALDWIN AND SON, Edith Nursery, Birchall Road, Leyton.

BEONIAS a SPECIALTY.—Awarded Four Gold Medals. Saved from Prize Plants. In beautifully illustrated Packets, choice mixed, Single or Double varieties, 1s., 2s., 6d., and 5s. per packet. Collections—Single, 12 named varieties, separate, 5s. 6d.; 6 named, 3s. 6d.; Double, 12 named varieties, from 2s. 6d. per doz. Unnamed Seedlings, 12s. to 21s. per doz.; Bedding, choicest, 6s. and 9s. per doz.; choicest Named Doubles from 42s. per doz.; Unnamed, very cheap, 24s. and 30s. per doz.; choicest Mixed, 15s. per doz. CATALOGUES gratis.

PERNS.—Pernis tremula, nice stuff, in Thumbs, 12s.; in 60's, 14s. per 100. For cash, J. PAXTON, Nurseryman, 31, Green Lanes, Stoke Newington, N.

SMALL COLLECTION OF ORCHIDS.—For Sale, good pieces of Cattleya gigas, Sandersonia, aurea, Lelia elegans, Cypripedium scutellatum, Spiranthes, Stonei &c.—GARDENER, Stam-life, Seaton Carew, West Hartlepool.

SUTTON'S SUPERB CINERARIA

Unsurpassed by any other strain in cultivation.

"The Cinerarias (of which I grow a quantity) are now making the Conservatory gay, and will do so for a long time, as I have several batches in different stages. They are undoubtedly the finest strain I ever saw, both as regards size and colour. I used to think that the coloured plates in your Catalogue were greatly exaggerated in regard to the colouring, but I have now quite changed my mind. I have at the present time several in flower which I defy the printer to excel, notably a deep blue and dark maroon. They are also possessed of a nice clean sturdy habit, which is greatly in their favour."—*Mr. CHAS. BLAIR, Gardener to Mrs. Malcolm, Ipswich, Longholm.*

Price of Seed, mixed colours, 2s. 6d. and 5s. per Packet, post-free.

SUTTON & SONS, READING.

VEITCH'S SUPERB PRIMULAS,

THE FINEST IN CULTIVATION.

Awarded a Special Certificate by the Royal Horticultural Society for superior quality.

VEITCH'S "SNOWFLAKE."

The finest pure white Fern-leaved variety. Flowers large, of fine form, massive substance, and exquisitely fringed. Per Packet, 3s. 6d.

VEITCH'S CHELSEA SCARLET.

The brightest and richest of all the high-coloured varieties. Per Packet, 3s. 6d.

VEITCH'S CHELSEA BLUE.

Flowers of a beautiful rich blue colour. Per Packet, 3s. 6d.

VEITCH'S CHELSEA ROSE.

A pretty and attractive variety, of a charming rose-pink colour. Per Packet, 3s. 6d.

"Veitch's Primulas are distinguished by purity, softness or richness of colour, great substance of blooms, and in most cases by exceptional size."—*Journal of Horticulture, January 27, 1890.*

For full descriptions of the above, see Seed CATALOGUE forwarded gratis and Post free on application.

tion, favoured us with a remarkable article, which, coming from a distinguished biologist, and the head of the most important botanical garden in the world, is invested with peculiar authority. It is none the less valuable or interesting, because some of its statements are, or appear to be, paradoxical.

Mr. Dyer starts with the case which presents itself so often to the gardener—that of a new comer to the establishment, one of whose peculiarities, structure, habits, and conditions of life little is known, and that little likely to be misleading. How is such a plant to be dealt with? Tentatively, experimentally, says Mr. Dyer, with perfect justice—or, to use his own word, “empirically.” The word empiric is here used as the antithesis to “rational,” but not in a bad sense, as the equivalent of quackery, as some correspondents have erroneously supposed.

Such complete ignorance is happily very rare; almost always we do know something about the plant, something of the country whence it came. It bears on its face more or less conspicuous indications of the kind of climate to which it has been subjected, and almost always, if sufficient time, patience, and skill be forthcoming, we can find out something in the conformation and minute structure of the plant which will give a clue to the circumstances under which it has been living, and those under which we may reasonably expect to be able to cultivate it in our gardens. Life, however, is short, time presses, and the ordinary gardener can hardly be expected to give much time to minute research, such as would be necessitated for this purpose. This latter point, however, in such an establishment as Kew, with its Jodrell laboratory, with every facility for bringing the resources of anatomy and physiology to the aid of the cultivator, offers less difficulty than elsewhere. The division of labour, and the differentiation of skill, can there be carried out to the reciprocal advantage of cultivator and man of research, in a manner impossible in ordinary gardens.

But, continues Mr. Dyer, if we had all attainable knowledge of this kind, it would be of little relative use—(1) because we cannot imitate the conditions under which the plant grows naturally; (2) because we have to grow the plant under an entirely new and artificial set of conditions; (3) because in Nature plants do not grow under the circumstances and condition most propitious to them, but rather where they can find room amid the crowd of competitors, and where they are not elbowed out by other and more powerful claimants.

All these statements contain much that is true, but not one of them is absolutely true. Objections and exceptions can be raised to each one of them. For instance, except in comparatively few cases, no intelligent gardener attempts to imitate Nature servilely. He knows full well that it is not to be done; or, if it could be, that it would not be desirable. The most successful gardener is he who knows how to make the plant grow, not as Nature wishes, but as he wishes it to grow with the means and under the circumstances at his disposal, and one who can adjust the balance between the several conditions such as light, heat, or moisture acting simultaneously, or alternately on the plant as growing in our gardens. Mr. Watson gives to the roots of his Narras, in the space of a few cubic feet, all the moisture it requires under a Kew temperature and a suburban illumination. In Nature the root has to go 100 feet or more in search of moisture. The conditions under which the plant grows at Kew, however artificial, do not seem to us to be absolutely

different or new, the principle is the same, the details, and especially the proportions, are different.

That Dean Herbert was perfectly correct in many cases in saying that plants grow where they can, rather than where circumstances would seem most propitious to them, is borne out by several of our correspondents. The fact is, that in such localities the conditions are even more favourable to some rival, and one, perhaps, which has obtained possession of the ground beforehand, and has established itself so thoroughly that competition becomes a matter of difficulty, or perhaps of impossibility, till the cultivator comes in, and by a slight modification of the conditions, or by exterminating one or more of the competitors, gives the others a chance.

Proceeding with his argument, Mr. Dyer disparages Nature as a gardener: “Nature is at best a very poor gardener,” says he. Well, we are inclined to ask, does she want to be a gardener? Is that her object? We should not have thought of disparaging Dame Nature for not being what she does not wish nor attempt to be. The objects and aims of the gardener in cultivating plants are one thing, as we have said, the object compassed by Nature in the wild state is often quite different. Were it necessary for Nature to be a gardener, no doubt she would attain a degree of proficiency that the bestowal of no Lindley Medal could adequately reward. Again, but for a certain hibernicism of paradox, we should say that we had often seen specimens of Nature’s gardening surpassing all that man can effect. But this is a digression.

Mr. Dyer goes on to say, and this we take it is the point he particularly wishes to emphasise, that the conditions under which plants exist in Nature afford very little real information of value to the cultivator. They represent the degree of toleration, or, as he puts it, the minimum, that the plant will tolerate, not the optimum under which the plant will attain its greatest degree of perfection. This, again, no doubt, is partially true; but here, again, we must remember that the objects of Nature and of the gardener differ widely. Moreover, it is certain that the defect above spoken of is less in the information itself, than in our power of turning it to account; as our knowledge increases and our power of applying that knowledge becomes greater, we shall hear less and less of the imperfections of Nature and of the inadequacy of the information she offers.

Mr. Dyer points to the fact that in many cases plants attain a degree of perfection under cultivation which they never attain in a wild state. That depends again on the way in which we look at things. A mammoth mangrel may be perfect in the eyes of the advertiser who has seed to sell, or even in the opinion of the grazier who has stock to feed; it certainly is not so in the eyes of a physiologist. This it is, we presume, which leads Mr. Dyer to state that “cultivation and Nature deal with problems which have scarcely anything in common except the plants they operate upon,” another statement which, we say it with all deference, appears to us too absolute. The machinery is practically the same in both cases, the means and springs of action are essentially the same. The working may be modified, enhanced, or diminished to meet altered conditions—but no new structure, no new method of work is introduced. It simply means a little more or a little less, a difference in degree and relative proportion, a difference in time and season. The principle remain unaffected, its application only differs.

In treating of the ideas represented by the words “adaptation,” “elasticity,” and “constitution,” Mr. Dyer points out a weak place. Such words are often used loosely for convenience sake, without due consideration of their real meaning. Each plant is capable of existing within a certain range of conditions, the range may be very wide or very narrow, it has a power of resisting adverse influences up to a certain point, this power is very variable in different plants and possibly in the same plant at different times. This ability to thrive under favourable conditions and to resist adverse influences is, we take it, what is generally confused with adaptation. We may change the conditions under which the plant grows, and provided we do not exceed the limitations which Nature has imposed, we may cultivate it successfully, but we can hardly be said to adapt it, or to effect any change in the plant in the way of adaptation. We may be able to put the plant under such circumstances as will allow the natural machinery to work, but that is all. Aucubas were grown in the greenhouse when first introduced, we know now that they are as hardy as Hollies. This, therefore, is no case of adaptation or acclimatisation. Our predecessors did not know the limitations under which it was possible to grow their plants.

The question again crops up, are there any indications, other than those furnished by experiment, which will enable us to ascertain the limitations under which a plant can be grown? Mr. Dyer says no. Mr. Ewbank, Mr. Watson, and Sir Charles Strickland are of the same opinion, but the former gentleman has qualified his statement, and the practice of the others shows at least that they know how to adapt their creed to the exigencies of practice. Unfortunately in very many cases, in the present state of our knowledge, the indications are wanting, or we are unable to perceive or utilise them. There is nothing, whatever, so far as we know, that would indicate even to the microscopist, that *Passiflora corulea*, a native of Southern Brazil, to cite only one instance out of hundreds, or perhaps thousands, would be hardly enough to survive our winters and ripen its fruits, and yet we know that it does so year after year near London. It is more especially in regard to the question of temperature that the indications, such as we have mentioned, fail. Rarely, if ever, do they give us any hint as to how little heat the plant will bear, or for how long a time it is able to resist a low temperature.

After reading the numerous articles, for which we are so greatly indebted to our correspondents on “A Gardeners’ Problem,” we are driven to the conclusion, which, in spite of some telling instances on the other side, was evident at the outset, namely, that our first attempts at plant cultivation must, as a rule, be empirical in their nature, and that too, even when treating for the first time plants of our own country. Here the differences are slight, but they include aspect, soil, water, and altitude; latitude and longitude not intruding at all, or at the most, very slightly into the question. The same points hold good for European plants generally, until we reach the extreme north or south of the Continent. The tropical or subtropical plants cause the most difficulty, owing to their cultivation being carried on necessarily under glass, and always in pots, tubs, or narrow borders—these of themselves exerting a dwarfing and enervating influence on the plants.

To show how, with plants now common in our gardens, we have made wrong starts in cultivation, and after years of partial failure have arrived at some approach to success, mention

may be made of certain species of trees. Those of us who are old enough to recollect the Conifer mania of forty years ago, will admit that many costly errors were made with these plants, and many species were planted which did fairly well for some years in many diverse parts of the country, but which, except in the most favoured parts of Ireland, Cornwall, Wales, and the Western Isles of Scotland, were sadly decimated by the winter of 1860.

These losses were partly due to our not knowing if the species were natives of mountains or plains, or if the knowledge on these points was at hand, it was disregarded by the planters. The

positions; but these are not the only sites or soils, and there are doubtless many others in which a species of tree grows—in some badly, in others indifferently, and in others again where it reaches perfection of growth. From which of these has the collector taken plants, or collected seed? He does not say if he has seen the plant in more than one, and the gardener is able to find out the best soil, position, &c., only after long experimenting.

To pass from trees to herbs, everyone would imagine the Canadian *Lobelia cardinalis* to be perfectly hardy in this country, yet we know that it needs some slight amount of protection,

NEW OR NOTEWORTHY PLANTS.

EUPATORIUM PROBUM, *N. E. Br., n. sp.*³ (See fig. 48).

It is very remarkable that so good a greenhouse plant as this appears to be should have been in cultivation for twenty years, and yet have remained undescribed until the present time! The history of it is briefly as follows:—It was introduced from Peru by Mr. Wilson Saunders about the year 1870, and in all probability the seeds of it were sent to him by Mr. Farris, who was drawing for him at about that period in Peru. A collection of the plant was made for the *Requium Botanicum*, but was never published, and is now preserved in the Kew Herbarium. I doubt if this plant is widely spread in cultivation, but a specimen of it has recently been sent to Kew by Mr. Ross, gardener to Sir George Macleay, Pendell Court, Bletchingley, who obtained the flower and shoot from Mr. Brown, gardener at Great Doods, Reigate, who had no idea whence the plant came. It is a soft-wooded greenhouse plant, and very free-flowering, and will be found quite as valuable for decorative purposes as *E. riparium*, *E. micranthum* (better known as *E. Weinmannianum*), and others of this class, although it has the disadvantage of being very viscid. *N. E. Brown, Herbarium, Kew.*

ARISEMA ANOMALUM, *Hemsley.*⁴

At first sight this is a very ordinary looking *Arisema*, and yet it is the most remarkable species that I am acquainted with. The name given to it by Mr. Hemsley is most applicable, although at the time he described it he was unaware of its most remarkable peculiarities. In the first place, the rootstock, instead of being a depressed-globose or subcylindric tuber, as in the other species, consists of a moderately stout creeping rhizome, bearing on it numerous crowded short rhizomes, something after the manner of an Iris. In the second place it is evergreen—that is, although some of the short rhizomes lose their leaf, new rhizomes arise at all times of the year, so that the plant is never without leaves upon it. No other species known to me has either of these peculiarities. It is one of the smaller-sized kinds, and, as it can be freely propagated, will no doubt become somewhat of a favourite with lovers of this class of plants, on account of its evergreen habit.

Rhizomes about 1 to 1½ inch long and ¾ inch thick, clustered at the end of, or along, a creeping rhizome, and each bearing but one leaf. Petiole, 8 to 10 inches long, terete, smooth, of a pale and somewhat translucent green, marked with white spots on the basal part; sheath exceedingly short, ¼ to ½ inch long; in the younger stages the base of the petiole is enclosed in a tightly clasping membranous sheath 2 to 3 inches long. Leaflets three to four, one of the lateral ones being sometimes divided into two, all stalked, the stalk of the middle leaflet ½ to ¾ inch long, and about twice as long as the stalks of the side leaflets; middle leaflet, 3½ to 7 inches long, 2 to 2½ inches broad, oblong-lanceolate or elliptic-lanceolate, somewhat abruptly contracted into a narrow point at the apex, which ends in a fine thread-like tip ¼ to ½ inch long, base rounded, lateral leaflets a little shorter than the middle one, oblique, and serricordate at the base, all entire, bright

³ *Eupatorium probum*, *N. E. Br., n. sp.*—The whole plant is everywhere clothed with soft glandular hairs, as I observed to the touch. Stems herbaceous, at least in the upper part; very leafy. Leaves opposite, petioles ½ to 1 inch long, the blade ½ to 1½ inch long, ¼ to 1½ inch broad, somewhat triangular-ovate acute, rounded or somewhat subcordate at the base, somewhat bluntly toothed on the margin. Flowering branches each ending in from two to four flower-heads, forming a flat-topped corymb of moderate size. Peduncles an inch long, bearing from one to four linear bracts. Heads about ½ inch in diameter, with from 80 to 100 flowers, white; involucre scales in one to two series, not imbricate, lanceolate acute, green, with membranous margins; pappus hairs few, scarcely barbellate. A native of Peru. Allied to *E. glechonophyllum*.

⁴ *Arisema anomalum*, *Hemsley*, in *Journal of Botany*, 1897 p. 205.

FIG. 48. *EUPATORIUM PROBUM*. FLOWERS WHITE; SEPARATE FLORID, AND HAIRS, MAGN. 3 DIAM. FORTY-EIGHT GRAINS MAGN. 300 DIAM.

locality was probably given by the collector, but not its altitude; and the plant whose habitat was in the warmer climate of the plain, and where it was sheltered by other trees, was killed by frost, whilst the hardier tree from the mountain range of the same latitude escaped all injury. Again, how would a collector, finding for the first time *Abies pinsapo* and *A. cephalonica*, *Cedrus Deodora*, *Sequoia*, *Pinus austriaca*, and others guess that these trees would arrive at fine proportions and remain in perfect health in a soil that mainly consisted of chalk; but which is nevertheless a fact that is demonstrated on several estates in the chalk districts of southern England. Other species of trees are found by collectors growing in certain soils and

all but our lowest winter's cold is 30° higher than that commonly felt in Canada. The blanket of snow is missing here; or, at least, it is not continuously spread over the earth. Instances might be multiplied a hundredfold, and they would surely prove that the gardener must, to a large extent, act in the first instance tentatively with foreign plants.

(To be continued.)

NEVILLE COURT, TUNBRIDGE WELLS.—The beautiful estate under the above name will soon come under the hammer, and will probably disappear as an intact property. Horticulturists should meet with sundry good things at the sale, the date of which may be found in our advertisement columns.

shining green, paler beneath. Scape 6 to 9 inches long, arising from the same point as the leaf, and sheathed by it at the very base for about $\frac{1}{2}$ to $\frac{3}{4}$ inch), or from the apex of a rhizome from which the leaf has fallen, terete, smooth, pale and somewhat translucent reddish brown, lined with paler, and towards the base sparingly dotted with white; the base is sheathed for 2 to 2½ inches up with three to four membranous sheaths marked with purple-brown lines and white dots. Spathe something like that of *A. nepenthioides* in form; tube $\frac{1}{4}$ to $\frac{1}{2}$ inch long, cylindrical, whitish inside, outside white at the base, the upper part marked with suffused stripes of lilac-brown or purplish-brown and whitish or pale greenish, the mouth with a recurved margin $\frac{1}{2}$ inch broad, bronzy-olive; the limb is $\frac{1}{4}$ to $\frac{1}{2}$ inch long, 1 to $1\frac{1}{2}$ inch broad, orbicular-ovate, cuspidate, ending in a short thread-like point, very strongly over-arching the mouth of the tube, slightly convex on the back with recurving margins, dull bronzy olive-brown with white veins on the back, and the inside with a green central area, and broad bronzy olive-brown borders veined with white. Spadix unisexual or bisexual on the same plant, exerted about half an inch beyond the tube; ovaries globose, bright green, with white stigmas, ovules three; male flowers of about four stamens united together, purple, as well as the few subulate neuter organs which are placed above or are mixed with them, and the part of the spadix which bears them; appendix slender tapering, curving forward at the apex, yellowish-green at the base, passing into yellow-brown, and then dull dingy green at the apex. A native of Perak. *N. E. Brown, Herbarium, Koor.*

A VISIT TO PROFESSOR FOSTER'S GARDEN.

A visit to this garden at Nine Wells, Shelford, during the third week of February, helped to confirm his statement, that "I always have some Irises in flower the whole year through," and I was somewhat surprised to find so many Irises and other plants in flower. It is impossible to visit the Professor's garden and not to glean much useful information about the genus of plants, for which he is famed; and he is moreover not one who hides his experience, but rather gives it freely and frankly.

The following is a list of Irises that were in flower at the time above mentioned:—*I. fibriata*, greenhouse plant—a beautiful species, deserving general cultivation; *I. Fosteraiana*; *I. Ilustrio*, a very distinct handsome, dark form; *I. Kratenis*, termed by Professor Foster the flower of winter; *I. orchioides*, flowering in a pot in the conservatory; *I. persica* var., said to flower more freely than the type; *I. reticulata* var. *Nelsoni*; *I. Rosenbachiana*, very variable, several varieties noted—Professor Foster told me that he has no less than twenty distinct varieties in his collection; *I. stylosa*, *I. Zingiriensis*, and *I. tingiana*.

Crocuses receive a good share of attention, making a very pleasing display, and amongst the most conspicuous were *C. alataicus*, *C. acryensis*? *C. erinus*, found to be not quite so hardy as the rest; *C. Balansii*, *C. biflorus*, *C. candidus*, *C. corsicus*, *C. Imperati* var. *purpurascens*, *C. Korolkowii*, *C. Inteus*—this varies in shade of colour; *C. sativus*, *C. vernus*.

Freesias for conservatory decoration are well grown, and I was shown the true *F. refracta* which is not nearly so handsome as the varieties in cultivation. Professor Foster is trying to have darker coloured flowers amongst them, by crossing and selection; and to some extent his efforts have had favourable results. *Primula floribunda* is worthy of note, because it is quite distinct from that generally grown under that name; it is not so large, the flower-stalks are shorter, indeed it is smaller growing altogether, very floriferous and seeds freely. It has become popular in the neighbourhood of Cambridge. Professor Foster said that he obtained it from G. F. Wilson, of Weybridge. *Narcissus minor* and *N. minimus* forms near to, yet distinct from each

other, and often confused by the trade, were also in flower. Some pretty forms of the *Primrose* were in flower, one of a pale lilac colour; also the blue form, *Dianthus gallicus*, a not particularly showy plant; *Koralkowia Sewerzowi* was coming into flower; also several good varieties of *Cyclamen* and *Helleborus*—*H. foetidus*, near to the road, was a striking object. *W. Horwood, Botanic Garden, Cambridge.*

FOREIGN CORRESPONDENCE.

WINTER-FLOWERING PLANTS AT LA MORTOLA.

THE La Mortola Garden has this year again given evidence of the possibilities of horticulture in the Riviera during the winter months. A list of more than 500 plants in flower during the last two weeks of December and the first two weeks of January, has been drawn up by the gardeners of Mr. Hanbury. Of course, we must take into account that Mr. Hanbury's is a huge collection, numbering more than 4000 decorative or economic plants; but the record is convincing evidence as to the favourable climate, once the barren and parched soil is brought under control.

There was but little rain in the last few months of 1889, and many plants in the garden suffered in consequence; but possibly this fact may account somewhat for the large increase in the number of plants in flower, as compared with the records published in the *Gardeners' Chronicle* in previous years. Also the winter has, on the whole, been mild; it is only since the beginning of February that there has been any definite amount of snow on the neighbouring mountains, whilst once only has snow fallen within the limits of the garden.

At present, each day shows the growth of the "second spring," for it has lately been a little over 60° F. in the shade, and shoots which produced leaves or flowers in November are often enough again covered in some profusion. Thus, it is quite novel, when accustomed to the regularity of a period of flowering and a period of growth, to see such plants as *Templetonia* in vigorous growth, and well covered with blossoms, when the pots of last November's flowering are not yet ripe.

The list of the 500 species that have flowered during the middle of winter may be analysed as follows, as to the natural groups of plants to which they belong, and the countries from which they have been introduced. The species are referable to some 200 genera, which are representatives of 80 out of the 135 natural orders of flowering plants grown by Mr. Hanbury. Of these there are nearly 30 poly-petalous natural orders, containing but one or two representatives; whilst such families as *Leguminosae*, *Rosaceae*, *Cruciferae*, *Malvaceae*, and *Rubiaceae*, show most prominently. The *Crassulaceae* are also well represented. Of the gamopetalous natural orders, Composite stands at the head of all, with its gay masses of tree *Dahlias*, *Diplopappus*, *Othonna*, *Senecio*, *Eriocarpus*, its curious species of *Kleinia* and the like. Nor are *Solanaceae* far behind in number, whilst certainly they are amongst the gayest.

We think this is a family especially cultivated at La Mortola, as evidenced by more than forty species of *Solanum*, by numerous bushes of the purple and magenta *Iochroma*, and of the glowing orange-yellow, or rich red, species of *Cestrum*; whilst other plants, as *Streptosolen Jamesoni*, with its exquisitely coloured flowers and graceful habit, *Nierembergia*, *Lycium*, *Datura* (of which *D. arborea* and *D. miniata*, have been most conspicuous) all confirm the opinion. We must here omit special mention of the decorative fruits of the *Solanum*, some of which have shown their rich scarlet or their golden balls persistently for the last three months. Among winter flowerers *Labiatae* and *Scrophulariaceae* are also well to the front, but in the former case it is on account of the great number of the richly coloured species of the one genus *Salvia*, rather than

on account of any number of genera which are decorative. Some score of other natural orders, among the Gamopetalae, contain one or occasionally a few individuals which bear gay flowers; whilst *Proteaceae* and *Thymelaeaceae* show abundant, and often highly decorative, representatives of their class.

Ephedra is the most interesting of the *Gymnospermae*, growing luxuriantly in the damper places, or producing a great quantity of flowers and rose-coloured fruits, when its rich tresses of delicately-branched stems are allowed to cover dry banks or walls.

Monocotyledons are not so abundant as might have been expected. It is too dry or the soil is naturally unsuited for them; except for the pest *Arum arisemaum*, but few are to be seen in any quantity. *Liliaceae*, *Iridaceae*, and *Amaryllidaceae* are represented by some score of genera; *Canna*, *Musa*, and *Aponogeon* being the most notable of other kinds in flower.

The countries which contribute to this display may be roughly grouped as follows, more according to the number of genera, than to the actual number of species mentioned in the list. It is necessary to note some such distinction as this, else, if each species were counted among the great number of *Erica*, *Salvia*, *Acacia*, &c., from one or another region, the relative proportions might be considerably changed. Rather more than 250 species were thus taken account of. Those from South America are about equal in number with those from South Africa and the Cape, each having approximately one-sixth of the total; Mexico and Central America together, show an almost identical total with the above, whilst Australia, India, and North Africa (together with the Canaries), severally yield but one-twelfth of the whole. The proportion from China and Japan is yet a smaller one, whilst Asia Minor and also North America appear only to be represented to the extent of a fiftieth part! If we do not count in the indigenous flowering plants (many of which are grown in the garden), the proportion from Europe is the same as that from India. Space does not allow us to mention more than the very commonest or most attractive of these plants, which are, of course, so different from the few winter-flowerers grown in Britain. Only here and there about the garden may be seen *Galanthus*, *Crocus*, *Eranthis*, *Helleborus*, which occupy so prominent a place in the open air with you. *Cyclamen*, *Primula sinensis*, and *Epacris* in plentiful variety are grown in sufficient quantity to satisfy the Italian gardeners' desire for "bedding-out" plants; but—only think of it—sphagnum moss well manured is the compost in which they flourish! We think a good deal might be said on the use of this moss, and the adaptability of plants to various situations, or rather their indifference to surroundings so long as requisite warm nutriment is obtainable. Imagine a gardener in England setting about to place *Epacris*, *Imantophyllum*, *Hardenbergia*, *Swainsona*, and a host of plants that might be instanced in other than sandy peat! *Camellia* of various species and varieties, *Diosma*, *Correa* (which deserves especial mention, inasmuch as it has been gay since October), *Pimelea*, *Lasiandra*, and *Il-litropium* have shown but a diminished profusion, or have flowered more abundantly as the winter has proceeded.

Yet these are not the especially noticeable plants among the large collection. We must instance *Salvia* in great quantity, *Aloe* (especially *A. ciliaris*, with its spreading habit, and its thousand scarlet, spike-like racemes), *Buddleia*, of bushy or climbing habit; *Echeveria*, *Cotyledon*, *Erica* (*E. blanda*, *E. barbata*, *E. arborea*, and others); *Begonia* in abundance, *Habrothamnus*, *Bignonia* (even the gayest *B. venusta*), *Hexacentris* (*Thunbergia*), *Bougainvillea* (the rich *B. spectabilis*), *Jasminum*, *Tecoma* (*T. capensis*, *T. stans*), *Sparmannia*, *Tacsonia*, *Fuchsia*, and, above all, a great wealth of *Roses*, if we wish you to picture the garden's riches at all adequately. Nor should the yet more characteristic species of *Hakea*, *H. eucalyptoides*, with the sphere of flowers resembling nought so much as a

small red "sea-urchin" (*Echinus*); *H. suaveolens*, *H. pugioniformis*, nor *Banksia*, *Eucalyptus*, nor *Grevillea* be omitted. Even *Acacias* and *Anemones* then showed signs of their now resplendent brightness.

Amongst more curious plants the gay species of *Cytosma*, several species of *Euphorbia*, and *Senecio*, *Azale*, *Dahlia Maximilliana* and *D. imperialis*, *M. canera*, *Viburnum*, and *Catha edulis* might be mentioned.

In instancing the above somewhat at random, I have selected especially those known in our English greenhouses; but there is often a very great difference between the specimens there grown and those thriving here in the open air. Do what we may, we cannot have the continuous Riviera sunshine, and without this, however, a well regulated temperature will prove too often a futile condition. *Philip Sewell*.

ROSES.

HYBRID PERPETUAL ROSES AND THE CONFERENCE.

In resuming the subject of Roses at the Conference, and the lessons all may gather from them, I have but again to repeat, and with even stronger emphasis, how much all rosarians are indebted to Mr. Wilks for the care he has bestowed in analysing the items sent in; for if this was apparent in the comparatively small class of Tea Roses, it is much more manifest in the returns of the hybrid-perpetuals; inasmuch as the number both of voters and Roses is greater, we can easily conceive what a *copious harvest* a whole thing would have been but for the energy and ability he threw into it.

The results are of a much more defensible and satisfactory character in this class than in the Teas and Noisettes, due to the fact that they are more generally grown, and that any one who grows Roses at all grows hybrid-perpetuals. Teas may be to him an unattainable treasure; he may grow a *Gloire de Dijon* on some wall or outhouse, but he cannot venture, or think he cannot venture, to grow Teas, while there are some to whom the more brilliant colour of the hybrids has greater attraction than the chaste and refined tints of the Teas, hence you will see hybrids in all gardens—and yet withal it is somewhat remarkable to find what divergence of opinion there is as to the best twelve hybrids, and to find that no fewer than six-eight varieties have been selected. I have not cared to examine the lists very closely, so as to see who is credited with the several varieties; but I am at a loss to understand how any one could have put such Roses as *Eclair de Morcen*, *Clara Cochet*, *Eugene Furst*, or, above all, *Baronne de Maynard*, in lieu of any of those which take the highest place. These twelve are *A. K. Williams*, *La France*, *Marie Baumann*, *Alfred Colomb*, *Charles Leblanc*, *Ulrich Brunner*, *Gabriel Luizet*, *Merveille de Lyon*, *Baroness Rothschild*, *Etienne Levet*, *Louis van Houtte*, and *Duke of Edinburgh*, and yet, high as some of these stand, and deservedly so, there are found a number of voters who do not include *A. K. Williams* in their list; while, stranger still, there are fourteen voters who leave *Marie Baumann* out in the cold; this is a matter to me quite incomprehensible. There is another fact worth mentioning, as showing how nearly these returns correspond with the actual facts. Mr. Mawley gave in a contemporary analysis of the Roses shown at the metropolitan exhibition at the Crystal Palace in 1883—I do not take 1889, for it was such an exceptional year—and on comparing this analysis with these votes, I find that there are nineteen out of the twenty-four which take their position amongst the first twenty-four in the number of flowers shown. Of course, this does not altogether go on all fours, because some early flowering Roses come in at an advantage, and some late blooming ones at a disadvantage. I am, for instance, strongly of opinion that *Victor Hugo* at a later season of the year would

attain a much higher position, while probably *Gabriel Luizet* would have gone somewhat lower down in the list. Then I cannot but think that if Mrs. John Laing had not been so new a Rose, it would have been oftener shown, as it is an incomparably better Rose than *Her Majesty*; the same remark applies to *Earl of Dufferin*, which I fully believe will take a higher rank when it becomes to be more generally grown.

The similarity of names, of which Mr. Wilks complains, and justly, as leading to confusion, is a matter for which I fear there is no remedy; raisers, and especially French raisers, like to dedicate their flowers to some of their relatives or friends, and as there are sometimes—as amongst the Verdiers—two distinct firms, this of itself leads to so many Roses bearing their names; while others are desirous of associating their Roses with the name of the place, call them by *Gloire de Belle*, and so on. We are not guiltless in this matter on our side of the water, as Mr. Wilks has shown, not only with Roses, but with other flowers also; thus amongst *Auriculas*, which comprises perhaps not more than 100 varieties, there are found two *George Lightbodies*, three *Ne Plus Ultras*, two *Britannias*, two *Apollos*, three *Uniques*, and so on. We must do the best we can, and in the meantime just remember how hard it must be to find suitable names for some fifty or sixty Roses year after year.

While, then, as I have said, there are some things which I cannot understand—as, for example, why *Marie Baumann*, or *La France*, should ever have been left out of any lists of the best twelve—yet, on the whole, we may safely abide by the decisions given, although individual fancy will place some in a higher position amongst the best twenty-four, and some in a lower place.

With regard to your correspondent "Rosa's" remarks on what I said with regard to two of the Tea Roses, I should like to reply. First of all, with regard to *Marie Van Houtte* and *Anna Olivier*, I have no wish to disparage the former, for I think, when caught at its best, with its lovely cream colour and its faint pink markings, it is exquisitely beautiful, and I merely wished to imply that I preferred *Anna Olivier*, because it had the true pointed shape, which I consider typical of the Teas, and in point of fact, *Marie* is much oftener shown than *Anna*, owing partly, I think, to the fact of its extreme vigour of growth, and the consequent greater number of flowers produced—but after all, this is a mere matter of taste.

As to *Homere*, I must still maintain my opinion that it is not an exhibition Rose; I have never seen it on a good stand, and this not simply for its small size, but because of its roughness, it is very difficult to get it in good form; in this I am borne out by the analysis of Mr. Mawley, to which I have already referred—the gave the number of times certain Tea Roses were shown at the Metropolitan show of the National, and although he gives the names of thirty-one Teas, *Homere* does not appear amongst them. This I think is conclusive, as to its position as an exhibition Rose—very pretty it is as a garden Rose, and this is I think its true position. *Will Ross*.

HOW TO TELL THE AGE OF TREES.

The practical horticulturist has many methods of getting at the age of a tree without counting the rings, just as a mathematician can tell its height without ascending to the top with a foot-rule—and some of these methods I adopted when in California, to test the assumed age of the big trees by their rings, and in every case the enormous age was confirmed.

One of these methods was to take a blaze mark, the age of which was known, and count the number of rings that had been made on the outer edge since the mark was cut. I found these averaged about 16 to the inch. Counting those in the centre of a cut across stump, which must have been its early

growth, I found them wider. The two together, and then averaged, would give a fair ratio of age per inch. If it took 21 of these to make an inch, which the cut on the outside proved it did, a tree 20 feet in diameter would be 1680 years old. We get at this much easier than by puzzling over obscure annual rings for half a day or more.

Another way to prove age is by noting the number of main side branches growing from the trunk in manyiferous trees, of which the white Pine and Norway Spruce are familiar examples. Looking at fine specimens of these trees, the branches seem stratified. This comes from the formation of the terminal buds at the apex of the growth of the leader. There is one very strong bud for the point, and three, four, or five strong ones beside it. All below are very weak buds. It is these strong buds that make the very strong horizontal shoots that afterwards give the stratified appearance to the whole tree. These in the white Pine of ordinary growth are about a foot or 15 inches apart, and even though the lower lateral branches die, they leave the "knots" by which their former existence can readily be seen. I saw Sugar Pines cut in California where a hundred or more of these branches or their knots would be readily traced, and the age fixed, and the rings of wood would exactly correspond.

But there is a method I have used that I have never seen referred to in print, and a method that has served me many a good turn when desiring to know the exact age of some fine specimen on the lawn of some place, when even the owner would declare he had forgotten when the tree was planted. It may be an evergreen with the branches growing close to the ground. The same principle I have referred to, of a strong branch pushing just below the terminal bud, and making a strong branch the next year, applies also to the lateral branches—indeed even more so, as very often the strong buds are the only ones that make a lateral during one season's growth. By counting the sections backward, I found the tree 25 years old, which I happened to know was its exact age. The height also is 25 feet, as I know by my shadow. I select a time when my shadow is exactly my height, and the tree's shadow will, of course, be the tree's exact height also.

Deciduous trees, equally with evergreens, have the strongest buds just beneath the apex of the annual growth, making stronger branchlets next year, by which the annual series may be determined; but as these leave no scars when they die away, it requires a practiced eye to determine where branchlets have been. But if a horizontal branch be in vigorous growth, the length of the last annual growth may be compared with the whole growth by a mean figure obtained between what we ascertain to be a good growth in youth, and the young growth before us. This, of course, is not an exact result, but one will be surprised to find, by the annual rings, how near it approximates.

Again, the age of many trees may be approximated by the rough bark. Old botanical text-books taught that the rifts in trees were mechanical. The bark split because the trees were pushing out. I believe it was left to me originally to show that this is an error. Every tree has its own distinct method of disrupting its bark, which could not be the case if the splitting were merely mechanical. The truth is, the splitting of bark arises from the growth of cork cells, and in each species these cells have a separate specific development, and usually at a specific age. In the Sweet Chestnut the bark commences to rift when 25 years of age, so that all above the junction of smooth and rough bark will be 25 years. I believe the Chestnut retains its smooth bark longer than any of those which eventually become rough. Some trees, like the Beech, never get rough, because the development of the cork cells begins and ends in a single year, and the bark exfoliates in the form of thin film. These kinds always have thin bark.

In these and other ways the practical man confirms the concentric ring theory, and is able to

assert, with considerable assurance, that the annual rings do mark the age of the tree.

I have found, when beaten out by these positive facts, that those who dispute them generally fly to other climes. They do not, they say, behave so in equatorial regions. They may or may not. I find people know so little of what happens in unfamiliar countries, that their failure to know about what is actually before them makes the assertion not worth an argument. *Thomas Mehan, Germantown Nurseries, Philadelphia.*

THE DECIDUOUS CYPRESS.

Our illustrations are taken from a tree at Sion of this elegant and remarkable species. The height of the largest specimen, shown in the photograph by Messrs. Byrne, of Richmond, is, we are told by Mr. Wythes, about 90 feet, so that it is not far short of the size attained by the tree in Florida. As it is perfectly hardy, and very distinct, it is a tree that may be planted in wet soils with great advantage. Even in the young state, its delicate foliage and elegant habit are very striking, and form delightful contrasts with trees of more massive contour and darker coloration. In nature it grows on the borders of rivers subject to periodic inundations, and at Sion it is planted in boggy soil near the edge of the lake. The trunk is stately, the foliage elegant and feathery, and, which is unusual among Conifers, deciduous, whence our American friends speak of the tree as the bald Cypress. In autumn the leaves turn of a reddish yellow colour, and not only are the leaves shed, but also many of the younger twigs, so that a natural process of pruning takes place. The beauty of the tree is spoken of in enthusiastic terms by travellers, while in other cases, the effect produced by the grey *Tillandsia* hanging in beard-like wisps from the branches of the trees, is weird and uncanny.

Bartram, in his *Travels through Carolina*, gives the following description of the tree:—"It generally grows in the water, or on low flat lands near the banks of great rivers and lakes, that are covered a great part of the year with 2 or 3 feet depth of water, and that part of the trunk which is subject to be under water, and 4 or 5 feet higher up, is greatly enlarged by prodigious buttresses or pilasters, which, in full grown trees, project on every side to such a distance, that several men might easily hide themselves in the hollows between. Each pilaster terminates under ground in a very large strong serpentine root, which strikes off and branches every way just under the surface of the earth; and from these roots grow woody cones, called Cypress knees, 4 to 5 and 6 feet high, and from 6 to 18 inches or 2 feet in diameter at their bases. The larger ones are hollow, and serve very well for beehives. A small space of the tree itself is hollow, nearly as high as the buttresses already mentioned. From this place the tree, as it were, takes another beginning, forming a great straight column 80 to 90 feet high, when it divides every way around into an extensive flat, horizontal top, like an umbrella, where eagles have their secure nests, and cranes and storks their temporary resting-places; and what adds to the magnificence of their appearance is the streamers of long moss (*Tillandsia usneoides*), that hang from the lofty limbs and float in the winds."

Mr. Montefiore recently published in *Murray's Magazine* an account of one of the typical features of a Cypress swamp:—

"It forms one of the most desolate scenes I have ever beheld. I have gazed on the black rocks of St. Paul's, standing almost alone in the Indian Ocean; upon the repellent ruins of St. Helena; on the salt marshes of the delta of the Godavary; the cruel solitude of Cape Agulhas—but I do not think I have ever seen anything so dismal, so desolate, as the Cypress swamps of Florida. You enter them almost without warning; you hold your breath, as it were, while going through them, and the feeling of relief on leaving them is only less strong than the strangely morbid attraction they have for you, and which makes you visit them again and again. The white-

barked Cypresses stand overhead, reaching to a great height, and spreading their limbs widely round, and yet there is not a leaf, not a single green leaf to be seen. From bough and branch and twig there hang long tails and festoons of Spanish moss, an air-filled plant, grey in colour, and looking for all the world like the dishevelled tresses of an aged woman. Everywhere you look, these sad grey hairs are either hanging listlessly, or swaying mournfully in the breeze. The water which is often 4 or 5 feet deep, even in the paths, if paths they can be called, which are selected by your guide, is coloured a dark reddish-brown by the quantity of tannin exhaled by the spongy mass of vegetation which everywhere underlies it. As you ride slowly through this dismal scene in Indian file, as the horse slowly forges ahead, the water washes up to your stirrups, and a sharp eye has to be kept unless, by a momentary departure from the narrow track you cannot see, you are to get a ducking. This dark, muddy water, silent and motionless, save where your party is churning it into something like frothy beer, is made even more dismal by its perfect reflections of the ghastly desolation overhead. It reproduces with startling vividness the long white trunks of the Cypress trees, and the tangled grey hairs of the Spanish moss. Now and again the harsh piping cry of some lonely water bird accentuates the stillness; here and there the deadly mocassin coils about the spreading roots, black and grimy with the stagnant water, and adds by its very movement to the uncanny, the desperate desolation of it all. Such is a Cypress swamp in Florida."

The "knees" above mentioned are abundantly produced at Sion, as shown in figs. 49 and 50, to the annoyance of the mowers, but they have not as yet attained the large dimensions mentioned by American travellers. In our museums, however, are specimens showing the very large size which these growths attain. It might be supposed that these knees were abortive shoots, but no bud or shoot of any kind has been observed proceeding from them.

In *Cryptomeria japonica* and in *Sequoia sempervirens* we have seen similar outgrowths from the root, but on a very much smaller scale, and these were provided with leaf-bearing shoots.

In the columns of our excellent American contemporary *Garden and Forest*, a discussion has of late been going on with reference to the use and purport of these productions. Dr. R. H. Lamborn contends that their function is to stiffen and strengthen the root, in order that a great tree may anchor itself safely in a yielding material. "When in a hurricane the great tree rocks back and forth on its base, and with its immense leverage pulls upon this odd-shaped wooden anchor instead of straightening out in the soft material as an ordinary root might; thus allowing the tree to lean over, and add its weight to the destructive force of the storm, it grips the sand as the bower anchor would do, and resists every motion. . . . No knees are developed when the tree grows in upland upon a firm bottom, in which ordinary simple roots can obtain in the ordinary way the hold necessary to resist overturning forces." In support of this opinion, Dr. Lamborn cites the authority of Elliot and Newberry, to the effect that the tree does really resist the violence of hurricanes to so extraordinary a degree, that the overthrow of a living tree must be at least of very rare occurrence.

Professor Shaler, however, considers that the function of the knees is to supply air to the roots, otherwise cut off by the water which covers them during a considerable portion of the year from all connection with the atmosphere. The largest trees are found in spots which are never dry, so that it becomes a question how the seed is to germinate in perhaps several feet of water. As a matter of fact, seedlings are only found on the margins of swamps in comparatively dry ground.

The wood of the deciduous Cypress is light and soft, but largely used for constructional purposes. Those who prefer popular names may take their choice between bald Cypress, black Cypress, red Cypress, white Cypress, and deciduous Cypress. The closely allied Mexican species, *T. mexicana*, attains still larger dimensions, but this species

is not in cultivation [in this country as far as we know.

The Taxodiaceae were once widely distributed throughout Europe and North America, as their remains in miocene times show. The access of the glacial period destroyed them, so that now they only occur in the Southern States, with one closely allied species in China, and these being, as supposed, out of the reach of the great ice influx, have survived to this day.

CULTURAL MEMORANDA.

NICOTIANA AFFINIS.

USUALLY this plant is raised from seed sown at this season of the year for growing in pots, borders, beds, &c. As a plant for early flowering it is neglected, although admired in summer and autumn for its sweet flowers. For this purpose, make a sowing in the middle of the month of September; prick out the seedlings when fit to handle, potting them singly when a few inches high, and keep in a cool frame until frost renders a more secure place desirable. My plants, put on to a shelf in the greenhouse, &c., in a short time began to throw up flower-stalks, and these plants, with an occasional watering with manure-water, have been flowering well from the first week of February. The blooms last much longer than in warm weather, and keep well open during the day; their perfume is, however, not so sweet as in the summer months, but this species of *Nicotiana* is still worth a trial as a spring flower. The foliage keeps strong and healthy, and it is free from insect attacks.

VERBENAS.

Some years ago the *Verbena* was extensively grown in beds and pots, and numerous varieties were then to be found in trade lists, and of these Purple King, Crimson King, and White Queen were chiefly grown; for filling beds these three seemingly having stronger constitutions than most of the others. Mildew never did much damage to these, although, in some gardens in East Anglia, where I then resided, this disease was a reason that these plants became unpopular. The beds selected to plant with *Verbenas* were deeply dug, and well manured every year. Much of the old soil was also replenished with fresh loam, woodashes, &c., together with a liberal application of soot, all of which were made moderately firm. The plants grew strongly with that dark green colour in the leaves so much admired, and flowered well till very late in the season. Propagation was done chiefly in the autumn from the tips of unbloomed shoots, which were put to the number of twenty in a 6-inch pot, and placed in a Melon-frame from which the crop had been cut. There was no coddling of the plants practised, but they were grown as hardily as possible without exposing them to frost. There was, however, a good deal of trouble in keeping the plants in winter, and this led many gardeners to rear the plants from seed; these, however, do not produce plants of one colour or habit—still they make fine beds, and are robust and free-flowering. Seed should now be sown in frames or boxes, and if a little bottom-heat can be afforded them till the plants get nicely established, they will make nice plants, afterwards inuring them to outdoor treatment. *H. M.*

PHLOX DRUMMONDI.

For transplanting in the last week in May, seeds of this pretty and useful flowering plant may now be sown, it being essential to have good branching sturdy plants to sow early. The grandiflora type has much bolder blooms; but the old varieties are not to be despised. Sow the seed in pans on a soil that is somewhat light and sandy, pressing the soil firmly before scattering the seed evenly on the surface, and cover the seed over with soil just sufficient to hide it, pressing it down smooth with a clean pot. Water the pans gently and sprinkle a little dry sand over the tops. The pans should be placed in a

warmth of 60°, till the plants have made some progress, when they may be pricked off either into boxes or a frame, and affording them a slight bottom-heat. When the plants attain the height of 6 inches, the points should be pinched out, and in May the plants should be gradually hardened off prior to planting in the beds. The colours may be kept separate in the beds, or mixed to suit fancy, and the growth must be regulated and pegged out to produce the best effects. *H. Markham.*

BERTOLONIAS.

The members of this genus are valued for their beautiful foliage, and are of easy culture, providing the gardener has a stove, and in which there is a place in it adapted to their growth. Perhaps the most handsome of all is *B. Van*

which is the easiest and readiest way. A few leaves may be employed for this purpose in spring and autumn, the plants raised taking the places of older ones, which in time become shabby. The leaves may be nearly matured, and should be placed upon pans of very sandy peaty soil, with good drainage beneath, the petioles being inserted in the compost, and the leaves cut along the midrib in one or two places and pegged down to the surface. A bottom-heat of from 80° to 85°, with a bell-glass over the pan, or a place in the propagating case, are necessities for success in striking the plants. When the young plants can be handled, they may be taken off with the attached portion of the leaf and pricked off singly into pots of sandy soil, keeping them in a close case, and syringing them once or twice a day until they are established. A 4-inch pot is quite

believe improperly, synonym) have not been conspicuous. There are some five distinct hardy species which are very easily managed. A warm sunny aspect should at all times be chosen for them, and, owing to the peculiar formation of the tubers, a deeply prepared and well enriched soil, with the qualification that it be light, and not of a stiff nature. Even though such a situation as suggested above is the best, it may nevertheless be remarked that *A. aurea*, if planted in a cool moist situation, will give a succession of bloom after those planted in drier soil have passed their best. Indeed, in gardens of limited extent, where the soil is of a somewhat retentive nature, this species may be relied on to succeed fairly well.

It may be well to add that the long fasciated roots, which strike deep, are not aided after planting by forking between the plants, hence it is the more imperative, if robust growth is to be ensured for a few years, to well prepare the soil previous to planting. Their peculiarly formed roots make the plant more liable than are roots generally, to injury by excessive winter rains, for which reason it is advisable to thatch the bed with straw, giving it a slope to shoot off the water, taking it away in February, and replacing it with a mulch of rotten farmyard manure. As the plants do little towards shading the ground, it is necessary that all who would succeed with these plants in a warm dry season should give the roots one or two thorough waterings.

The young shoots and foliage are subject to be eaten by slugs, but no insect pests in this country do any harm to the plant. It is necessary, therefore, and especially in old gardens abounding in these destructors, to be constantly on the watch for slugs. Plant the tubers from 8 to 10 inches below the surface.

Certain species are not so hardy as others, and must either be grown in pots, for which purpose their long roots tender them unsuitable, or in pits or frames. I therefore give the names of such as are suited for outdoor culture only, and those suitable for conservatory or pit separately. Hardy border species comprise *A. aurea*, *A. aurantiaca*, *A. braziliensis*, *A. chilensis* (and its sub-varieties), charming dwarf forms; and the crimson or parrot-like *A. psittacina*.

Tenderer species consist of *A. hemantha*, *A. Peregrina alba* (Lucas Lily), *A. oculata*, *A. peruviana* (in variety), *A. Hookeri*, *A. sulphurea tigrina*, *A. tricolor*, and *A. violacea*—to say nothing of Van Houtte's hybrids, obtained from Dr. Hooker's species and *A. hemantha*. Finally, all who cultivate them in pots should choose the deepest form of bulb pot. Carefully keep the plants in full sunshine, else robust growth and good bloom are not probable results. *William Eley, Wood.*

FIG. 49. TANODIUM DISTICHUM IN WINTER, SHOWING THE "KNEES." (SEE P. 321.)

Houtteana, which has ovate-lanceolate leaves about 4 inches broad at the widest part, and between 7 and 8 inches long, the ground colour of a rich olive-green, the principal veins of a bright magenta, the leaf being dotted all over minutely with the same colour, and from each of these dots arises a hair, and the petioles are likewise furnished with glandular hairs. The height of the full grown plant is 5 to 6 inches. It does best when kept in a shady part of the stove and under a bell-glass, as a protection against variations in the temperature, which cause the leaves to lose their remarkable lustre. *Bertolonia marmorata* and some others of similar characteristics are not nearly so tender as the one above mentioned, and are able to thrive unprotected by a glass. It should have ample drainage, and a compost of fibrous peat, sand, and some finely broken crocks mixed together. This is a good example of a plant that may be propagated from the leaves, and

large enough for a well-grown specimen, and in this way the leaves are developed better than when two or three are crowded together into a pan. *W. Harrow, Botanic Garden, Cambridge.*

ALSTROEMERIAS.

It is difficult to understand why certain hardy plants of merit are all but absent from gardens, whilst others of less value decoratively, quickly obtain popular favour, and find their way readily into every garden. The more hardy *Alstroemerias* are some of the most beautiful but neglected of flowers; happily, however, we have of late years rarely seen collections of twelve or twenty-four bunches of cut blooms of hardy herbaceous plants, with the 1st prize attached, wherein *Alstroemeria aurea* or *A. aurantiaca* (considered by some, but we

THE APIARY.

SELF-HIVING ARRANGEMENTS.

It seems very early to be talking about swarms, but though the weather is bitterly cold at the time we write, it will pass away like everything else, and warm weather and the singing of birds will succeed. It commonly happens that ordinary mortals are too much occupied in these days with business matters to look after swarms, and if any contrivance can be secured which will prevent this waste of time, it is of great value.

Two persons have come to the front with appliances for preventing swarms flying away, though unwatched, and for compelling the bees to live themselves. One of these is the great queen-rearer, Mr. Alley, of America; while the other hails from Lancashire, Mr. Alley takes two drone-traps, and puts one in front of a hive which is about to swarm, and the other in front of an empty hive prepared for a swarm. He connects the two drone-traps by a small, perforated, circular tunnel. The hives are placed side by side. When the bees issue there is

nothing for them to do but go through the tunnel prepared for them into the other hive. We see only one thing which may cause failure, but that is rather serious. It is well known that bees issue in immense numbers, and possibly the tunnel might be blocked, and a large number of bees—with, perhaps, the queen—would be suffocated. This would be fatal to success, although Mr. Alley expects no such catastrophe. He of Lancashire acts rather differently. He places the empty hive opposite the hive expected to swarm, with entrance of one opposite entrance of other. He then places a very much larger and wider tunnel than Mr. Alley's between the two hives, and leaves the bees to their own devices. As the tunnel is so much larger than Mr. Alley's, and there is nothing to hinder the straight flight of the bees, there is much less chance of failure. In the American contrivance the bees have to turn at once to the left or the right when they leave the hive. Now it is well known that when bees swarm they rush out in a straight line, and therefore Mr. Alley's seem to lack the first elements of success. If we valued our swarms at all we should not like to trust them to Mr. Alley's contrivance, but we see no reason why the English method should not be a success. It is, at any rate, well worth a trial, except you have time to watch your bees all day long. *Bee*.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM MAXILLARE.

A MEXICAN Highland species, requiring, says M. Linden, for its cultivation a cool, well-ventilated greenhouse, with relatively little moisture during the resting period. The flowers are star-shaped, with a lanceolate whitish segment, each with a purplish blotch at the base. The lip has a broad yellow stalk, streaked with red, whilst the blade is ovate-acuminate. *Lindenia*, t. 209.

ÆRIDES AUGUSTIANUM.

A coloured figure of this species is given in the *Lindenia*, t. 210.

CATTLEYA MAXIMA VAR. MALOEUANA.

A variety, remarkable for the deep purplish rosy colour of its segments. Only one plant is at present known—that in the collection of M. Warocqué. *Lindenia*, t. 211.

RODRIGUEZIA REFRACTA.

Flowers flushed with rose, sprinkled with purplish dots. *Lindenia*, t. 212.

ZYGOPETALUM INTERMEDIUM

is very like *Z. MACRUM*, but has a more rounded lip, deeply bilobed and pubescent, and with a less deeply lobed callus. The plant requires to be grown in a warm stove as near the glass as possible, but protected from the direct rays of the sun. As the plant is almost always in growth, the roots should be kept moist. *Lindenia*, t. 216.

ODONTOGLOSSUM ROSSI.

A correspondent kindly forwards an interesting flower, in which there are two additional lips, representing the two stamens of the outer series (A2, A3), which are usually suppressed. Traces of the third stamen (a3) of the inner row are also present.

HOULETTIA BROCKLEHURSTIANA.

This remarkable and handsome species should, according to M. Linden, be grown in a well drained pot, filled with sphagnum with lumps of peat and crocks, and placed in a cool and well ventilated house. During growth, abundance of moisture should be supplied. *Lindenia*, t. 214.

DENDROBIUM MIRBELIANUM.

Although described sixty years ago, this species has not been introduced into gardens till recently,

when it was imported from New Guinea by one of the collectors of the Horticulture Internationale. The segments are narrow, acute, greenish-yellow, streaked with green lines. The petals are similarly marked, but are much longer; the lip is three-lobed, the lateral lobes rounded, erect; the anterior lobe ovate acute, similar to but lighter in colour than the other segments, and with three keels.

ODONTOGLOSSUM HASTILABIMUM

grows, says M. Linden, generally upon trees in the shade, and in spots exposed to constant evaporation. It is a plant requiring abundance of moisture and a temperature of 10° to 15° C. The young growths should never be syringed; the flowers are large, flat, star-shaped, with a yellow lanceolate segments, transversely barred with red, and with an ovate acute white lip flushed with rose. *Lindenia*, t. 213.

CATTLEYA LABIATA VAR. ROCHELENSIS.

This is botanically a form of *Cattleya labiata* of the Warscewiczii group, and is remarkable for its flowers, which, with the exception of a yellow blotch in the throat, are pure white. The only plant known is in the collection of Mr. F. L. Ames, of North Easton, Mass. A very fine illustration of a noble variety is given in *Reichenbachia*, t. 85.

ODONTOGLOSSUM TRIUMPHANS.

A cool Orchid, of great beauty and value, as flowering in winter. *Reichenbachia*, t. 86.

PHALLOPSIS CASTEA X

A supposed hybrid between *P. Schilleriana*, of which it has the leaves, and *P. aphrodite* (= *amabilis*, Lindley), of which it has the flowers. *Reichenbachia*, t. 87.

ONCIDIUM TIGRINUM

produces its large branching racemes of bright yellow and tiger-blotched flowers at the duldest season of the year, when they are much needed, that is from the latter end of autumn to New Year's Day. Mr. Sander recommends culture in baskets for this species, of which a fine figure is given in *Reichenbachia*, t. 88.

FLORISTS' FLOWERS.

THE AURICULA.

THESE lines were penned in the last days of February; it was then bitterly cold. An enthusiastic amateur wrote me more than a month before about the forwardness of his plants, stating that they were never so forward as then. Of course he had in his mind the National Auricula Society's show, which is fixed for April 22, and wondered if he would have plants in bloom when the show day came. I hinted to him that it was best to admit air to the plants in abundance, by removing the lights altogether in fine weather, and tilting them whenever there was no frost; the plants, which have been freely exposed to the weather, will be the better able to withstand the low degree of cold we may yet experience. Many growers have only a cold frame for their plants, and this should be double matted, the mats hanging well over the sides and ends of the frame. In any case, the trusses must not get frozen, and therefore single mats are not safe till the month of March is past.

The main portion of our collection is now in a house which may be heated, and no more heat is ever used than will just keep out the frost. Sifts and alpenes are not injured by frost as are the green and grey-edged flowers. Trusses are not showing above the leaves yet, and we should take care to keep the plants cool and well ventilated. Another season's experience has brought conviction to my mind, that the usual spring dressing of some rich compost is not only unnecessary, but may sometimes be hurtful to tender plants. February and March are perhaps the best months in which to remove the offsets, and there is scarcely a failure when the potting is carefully done, and the plants placed under handlights. These offsets soon get established, and flower well in the following season.

The old specimens of Auricula may be grown on for several years; but there comes a time when the vigour of the plants declines; the stem decays from base upwards, and fewer fibres and weaker trusses are produced; and if stock is wanted, these plants should be cut over at the ground level, and the crowns put into small pots of sandy soil, nursing them until a crop of offsets is produced. The offsets propagated in summer and autumn, and wintered in thubs, may be repotted during March. These will push new roots in quantity into the fresh soil, and by careful culture they will make excellent plants, which will flower the following year. "How often may the plants be watered?" may be asked by gardeners and amateurs. The reply usually given, "When they need it," is too vague, and yet there is no other that can be given. The Auricula does not require large supplies of water at any time, and the soil should be dry before water is applied. Those who give water to the Auricula plants before it is needed cannot expect to be successful. The hand-glasses put over unrooted offsets should still be kept closed, but care must be taken not to let the offsets damp off; and it is, therefore, well to examine the plants frequently, and wipe off the moisture which condenses on the glass. *J. Douglas*.

PLANTS AND THEIR CULTURE.

STOVE PLANTS.—The operations of re-potting and dressing should now be completed, the inmates suitably arranged, the glass and woodwork cleaned, and fresh material used for the beds and stages—a point that is sometimes neglected. Cocoa-fibre refuse, fine gravel, or Derbyshire spar is of benefit to the plants when these stand over or near hot-water pipes. The temperature should be slightly increased, and should now range from 65° by night to 75° and 80° by day, allowing a few degrees' higher day temperature in bright weather. Not much air should be given, so as to assist the plants to make root and top growth. The house must be kept moist, and this will check the spread of insects, syringing several times daily the floor and walls of the house. The blinds should now be fixed up. The early potted Allamandas, Clerodendrons, and Bougainvilleas should be growing freely; also the Allamandas and Bougainvilleas should now get all the light and sun, but keeping the shoots clear of the glass. Another lot of these plants should be started, to succeed the earlier ones.

Dipladenias, if re-potted early, will be growing freely. These plants are difficult to keep in a healthy condition if over-watered. The shoots should be trained to string put up close to the roof, and only slightly shaded when the sun is very bright. If any re-potting is required at this date, the plants should be plunged afterwards in mild bottom-heat. Excess that were started early in the season will take water freely, and sometimes a good fertiliser as freely, and pinching the shoots when new growths unduly take the lead. Young plants may be re-potted, using for the purpose the best peat, and in good-sized pieces, a small quantity of charcoal, and coarse silver-sand, shading them until they begin to grow.

A few plants of Gardenias may be placed in a cool house, to furnish late flowers. The flowers are improved in size and substance by liquid manure being often supplied to the plants. The house in which they stand should be kept thoroughly moist. A small pit or frame suits them if more warmth can be given them than the stove affords. Young plants produce the finest blooms, and it is best to strike cuttings every year in January or February. The cuttings should be strong ones, and be grown without check. The older or one-year old cutbacks are useful for planting out if a pit can be afforded them.

Vincas are useful when they are well grown, and require to be frequently stopped to keep the plants in good form, growing them at the cooler part of the stove. Shrubby growing Clerodendrons should be well cut back, and started into growth shortly afterwards. Pinching of the shoots is also required by these plants and for the same end. Euphylliums should get a place on a shelf at the back of the stove. We never shade these plants during growth. The early sowing of *Torenia* will be ready to pot off, and should not be allowed to make weakly growth.

Another sowing of these trailers should be made, likewise of *Aphelandra arnantiaca* Roellii, a useful winter bloomer, whose scarlet flowers are generally admired. The main supply of *Achimenes* should now be started in boxes or pans; the plants being put into their blooming pans and baskets when they reach 2 inches high. Plenty of heat and moisture are necessary in the early stages. A few tubers may be kept for very late work, to be started in a few weeks hence. *G. Wythes, St. n. Bonfield.*

THE ORCHID HOUSES.

EAST-INDIAN HOUSE.—The *Phalenopsis* should not be allowed to flower for too long a time, but should be cut and placed in tubes near the plants, or put into vases of cut bloom. Should late spikes push from *P. amabilis*, *grandiflora*, *Sanderiana gloriosa*, or *Schilleriana*, that have flowered much during the season, they should be at once removed. Growers of Orchids near London affirm that it is easy to grow *Phalenopsis* in the country, and forget that the fogs which they suffer from save the plants in many cases from being killed by over-flowering. One month is long enough for any of these plants to remain in flower.

The above *Phalenopsis* as they go out of flower should have all the old materials removed from the pot or basket, the roots rinsed in tepid rain-water, to remove every particle of decaying matter, and the whole packing material should be made good, clean potsheds, a few nodules of fresh charcoal, and sphagnum placed on the surface, and this last should not be in excess, as much sphagnum keeps the plants wet for too long a time, and it is much better to have less materials about the plants, and supply the plants with rain-water at frequent intervals.

As the days lengthen more moisture will be necessary, as many of the occupants of this house will be in active growth. Attend carefully to the shading of the *Phalenopsis*. The temperature may still remain at 65° at night, a rise of 10° or 15° by sunheat doing no harm. When a warm, sunny day is anticipated, the hot-water pipes should be allowed to cool, as hot sun and pipes lightly heated are the cause of insects attacking the foliage of the plants.

Cattleya-house.—The potting of the occupants, as previously advised, and which may not have been done, should be pushed on with vigour. *C. amethystoglossa* and *C. Trianae*, as they pass out of flower, should be attended to without delay. *Dendrobium Falconeri*, which may have been resting in cooler quarters, should be syringed overhead every day, even when at rest in a cool house. *D. thyrsiflorum*, *D. densiflorum*, *D. Deyanum*, &c., may now be brought into this house. The air not being so fully charged with moisture as the intermediate-house, it suits them better after a long term of cool treatment. A temperature of 62° at night will be sufficient, and if this can be maintained by the hot-water pipes, with a small amount of ventilation, it will be better for the plants. *A. G. Cox, Parkfield, Worcester.*

THE FLOWER GARDEN.

PRUNING AND TRAINING.—The pruning and training of climbers, *Roses*, &c., on walls, should be brought to a close, as, in many cases, from their position, growth has commenced. Cut out only the old and weak shoots of *Ra* *Roses*, laying in the best place of the more vigorous shoots, removing only the unripe tips of these.

Magnolias require to be gone over carefully, and all shoots made secure to the trellis or wall, for the foliage being large, the winds have great power over them. *Chimonanthus fragrans* and *Aspidium nodiflorum* have finished flowering, and should be spurred in, training out the leading shoots if there is room to extend. *Wistarias*, *Loniceras*, *Jasmines*, *Passion-flowers*, &c., should all now be spurred in, and all fastenings examined and made secure. Those *Clematis* generally the early kinds—that flower on the ripened growth, should only have their dead wood cut away; but the later-flowering *Jackmani* type of *Clematis*, which flowers on the new growth, may be cut back more freely, with a view to producing plenty of young and strong growth. *D. C. Powell, Powderham, Devon.*

THE HARDY FRUIT GARDEN.

Fruit trees have been beneficially checked by frosts of 15°, 17°, 17°, and 25° coming in succession. Sharp morning frosts will continue to be experienced all over the country for some time yet, and all material for protecting blossom must be got ready for use. In the next fortnight wall trees will make great progress, and thick coverings prematurely put up must be avoided, as this would only render them more liable to injury—a few degrees of frost does less harm.

Planting.—If any of this is still in arrears, the next fortnight should see the end of it generally; but such late planting is very hurtful to trees above the size of maidens. The latter will frequently thrive as well, if moved carefully about this time, as when transplanted in the autumn. Remembering the bad effects of exposing the roots of trees to dry air at this date, the trees should not lay about unprotected, but be heeled-in until planted. Trees sent in from nurseries should have moist-materials put round about their roots, but if the ground is in a saturated state, a few shovelfuls of soil from under cover should be thoroughly worked and pressed firmly about the roots. If the soil is adhesive, the planting had better be deferred until it is drier. Planting late means more attention in watering, if the spring and early summer months should prove to be dry. Syringing overhead during sunny weather is beneficial, as it prevents shrivelling of the wood.

Scaberrimis autumn planted should be examined, and the plants made firm by treading the soil about them when the latter is dry. All vacancies should be made good. The old leaves which retain their green colour should not be trimmed off, as they form shelter for the new crowns and aid in the formation of surface roots. The first early forced plants should be saved for planting out for autumn fruiting, and must be placed in a cold frame as soon as the fruit is gathered, being gradually hardened off from that time. *Nicomessse Hericant* du Thury, *Luxton's Noble*, *Keen's Seedling*, and *La Gros Sacré* do well in this way. Where plenty of long manure is at command, the present is a good time to apply it to the bed. *A. Evans, High Hill, Hants.*

FRUITS UNDER GLASS.

Ventilation. Under such circumstances as prevail in March, it is better to allow the temperature on days when the sun shines brightly to run up beyond the maximum, than to admit much of the keen air from without, which is certain to cause a sudden and injurious extraction of moisture from the air of the house, and resulting in drooping foliage and general distress. In a few cases, such as of plants newly potted, rootless *Pine-suckers*, young *Melons*, and *Cucumbers*, it may be advisable to give a very slight thin shade over them for an hour before and after noon; but all foliage should be insured to stand the sun as speedily as is consistent with safety. Plants that have hitherto received night ventilation will possess foliage capable of withstanding the treatment advised.

Pines.—The forwardest fruiterers under increased temperature will soon show signs of ripening, and may be urged forward by shutting up early. As soon as colouring has commenced, gradually withhold water at the roots. Those *Pines* that are grown in pots have advantages at this stage over those planted out, besides, in these days of express speed, space is likewise economised. Less forward fruiterers will be assisted by applications of warm liquid manure made of guano, soot, or sheep's dung, varied with occasional sprinklings of some sort of artificial manure. Plants that were matted about to prevent injury from a too strong bottom-heat, may now have the tan pressed closely round the sides of the pot, the heat having probably subsided to a safe point. With successional plants maintain considerable moisture in the air to assist the foliage. Nothing is more injurious to *Pine*-apples than excessively warm pipes and bright sun acting together, such a state of things creating a parching air that is most trying to them. Every time that watering becomes necessary, give a handful of Peruvian guano to a 1-gal. can of warm water, and let it settle before decanting it for use. Rootless suckers potted in February into 8-inch pots will require but little water—comparatively; as if once over-watered, and the soil soured

thereby, progress is very slow afterwards; it is, therefore, necessary to turn a sucker out of the pot now and then, and see what the soil is like. Any suckers growing on old stools, as soon as they have reached a good size, to be detached and potted.

The Vines.—Growth will now be active, and where the trellis is fairly covered with foliage, the sub-laterals, with the exception of two, more or less, according to space, should be pinched clean out. Train in new canes where practicable, with a view to fruiting next year. Such canes will give lanky branches; but if Vines have all, or nearly all, their growth spurred close back every year they will decline in health, hence the necessity for some moderate amount of extension. Extension training certainly suits the *Muscat of Alexandria*, *Madresfield Court*, and other *Grapes*. *Pot-vines* and early started *Black Hamburg* will soon show colour in the berries, and this brings forcing to an end, as time is a very necessary factor to good colouring, atmospheric moisture being also gradually withdrawn, and clear water supplied, manures given at this stage being adverse to perfect colouring. Keep a little top air on at night, and a pleasant warmth in the heating apparatus. Follow up the disbudbing of mid-season Vines; push on the temperature daily where bunches are showing, which will add length and size to the bunches; thin out laterals rather more severely, and aim at securing foliage of good size and substance. Atmospheric moisture must not be carried to excess, otherwise air-roots and warty excrescences on the under-sides of the leaves will follow. Late Vines which had unripe wood, and which is always subject to bleeding, should have small *Potatoes* stuck on to the ends of bleeding shoots. This is a good remedy. If any planting is in contemplation, the cutbacks for this purpose should be retarded for as long a time as possible, to be afterwards laid out on ratts or hanper lids, and covered with fine earth, till the borders are ready for them in May. *W. Craup, Madresfield Court, Malvern.*

THE KITCHEN GARDEN.

Asparagus Beds.—These having been properly cleaned of weeds, and manured with farmyard manure in the autumn, should now be pricked over lightly and raked with a wooden rake, leaving plenty of short dung on the beds. If the soil is light, give it a dressing of salt or fish guano, which, besides acting as fertilisers, serve to keep the beds free of weeds, &c. In the case of new plantations, if the soil for the beds has not yet been prepared, no time should now be lost in getting it in readiness. The best time to transplant the roots will be found to be just as growth commences, which is usually at the beginning of the month of April. If the plants are to be raised from seed, drop the seed in three or four at a distance of 15 inches apart. If very fine heads are wanted, the best results will accrue if 2 feet from plant to plant be allowed; and should the soil be wet, do not sow until it is drier. Sow in drills thicker if for transplanting another year.

Peas.—Those sown in pots may, if hardened off, be transferred to trenches, choosing mild weather for the work. Shelter the plants with evergreen twigs, and draw a little earth up to them. The stakes may be put to the rows if they are in readiness. Ascertain if Peas sown outside in February have perished or suffered in any way; another sowing of the early Peas should at once be made if loss has been incurred. The seed may from now, and onwards be sown more thinly, especially of strong branching varieties.

Lettuce beds on warm borders should have the gaps in them made good from the seed-beds. Trample round plants which may be loosened by frost, and use the Dutch hoe between the rows. A bed should now be planted of plants wintered in frames to follow up these *Lettuces*, selecting for its site a warm aspect; these should be taken up and planted with the trowel. Let the soil be made firm by treading before planting, and plant generally at about 1 foot apart. Sow seed out-of-doors, and sow at fortnightly intervals, or according to the demand.

Radishes.—Early Wood Frame should now be sown on ground in good heart, covering the bed until the plants appear with light litter, but raking it off directly the seed germinates.

Small sowings of Cauliflower, Brussels Sprouts, and Savoys, may be made. Spinach beds may be hoed in dry weather, also Cabbage and winter Onions. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on one side only of the paper, and sent as early in the week as possible.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, MAR. 20—Linnean Society.

SHOWERS.

TUESDAY, MAR. 18 { Munchest. Royal Botanic, (Rehmanit, Surrey (two days).
WEDNESDAY, MAR. 19 { Preston and Fulwood (two days), (Rath Bulb (two days).

SALES.

MONDAY, MAR. 17 { Lilies and Greenhouse Plants, (at Protheroe & Morris' Rooms,
TUESDAY, MAR. 18 { Roses, Palms, &c., at the City (Auction Rooms, by Protheroe & Morris.
WEDNESDAY, MAR. 19 { Roses, Border Plants, Fruit Trees, (Sirubs, Plants from Ghent, &c., at Stevens' Rooms
THURSDAY, MAR. 20 { Lilies, Greenhouse Plants, &c., at (Protheroe & Morris' Rooms.
FRIDAY, MAR. 21 { Orchids in Flower and Bud, at (Stevens' Rooms.
Nursery Stock from Sample, at (Protheroe & Morris' Rooms.
Imported and Established Orchids, at (Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—43°.

It is satisfactory to those who, like ourselves, have for many years past devoted attention to the subject of insect depredators, and to the means of dealing with them, to find at last that public attention is being aroused to the importance of the matter. At a meeting recently held at Evesham, the Mayor in the Chair, the subject was discussed at some length. The ways and customs of the caterpillars were described in a letter from Miss ORMEROD, as well as the various remedies proposed. Greased bands applied in October are very effectual, but injure the young trees. This injury is avoided by smearing the grease upon paper, or, as Mr. WILSON suggested at the Scientific Committee, on canvas, and not directly on the bark itself. Kerosene emulsions in the proportion of one pint of kerosene, half an ounce of soap, and four pints of water, to be used in the form of spray, were also recommended. But the most promising method is that which has been tried for many years in the United States and in Canada, and which, relying on the reports of such men as Professor RILEY and Mr. FLETCHER, we have earnestly pressed on the attention of our fruit growers for years past, but hitherto without avail. Either from our national slowness in

adopting new processes, or from a fear of injury from the arsenical preparations, little or no progress has been made in this country with these valuable remedies; and yet the proportion used is so small that the risk to human life is too small to deter any person of ordinarily careful habits from making use of them.

Spraying with an arsenical solution should be done in the middle of April, when no fear need be entertained from the falling of the arsenic on to bush fruits grown under the Apples, though in the case of vegetables the case is somewhat different. The proportion of Paris green recommended is 4 oz. to 40 or 50 gallons of water (four ounces to forty or fifty gallons). In the 40 gallons there would be about 1 oz. of arsenic, and this would be distributed by the spray pump over, say, an acre of leaf-surface. The danger, therefore, is clearly not in the proper use of the arsenic, but in the careless handling of the poison by ignorant or stupid people, a contingency which has always to be provided for.

We extract from the *Evesham Journal* the following letter, showing more explicitly how these arsenical preparations are used:—

"To every 50 gallons of water, mix well, and keep well stirred while using 4 oz. of Paris green. For Plums, as they are tender, and as the leaf is glossy, add three table-spoonfuls of fine flour from Wheat to make it stick on the leaves. Get a pan or dish, and make a paste of either or both, with a little water, as it mixes better with a bulk of water, and test it. If too weak, use 4 oz. to 40 gallons. If the Paris is a pure article, this will be found enough. Use 4 oz. to 40 gallons of water for Apple and Pear trees. Cherries may be treated the same way. Two dressings will, as a rule, be sufficient—1st, when the blossoms are falling and fruit beginning to form; 2nd, in twelve to fourteen days. Use your best judgment on this by observation. As soon as blossoms have fallen off, and while fruit is nearly upright, get a force-pump fixed, good, short, and handy, and in a barrel on wheelbarrow or wheels that can be moved handy to any place. Have a rubber hose of 1 inch by 8 feet long, or longer for tall trees; fix this on a handy pole, so that a man may shower ordinary trees without a ladder, and shower trees where insects are, much the same as a fine water-trip-pot rose would shower. Test your pump beforehand with clear water to get it to work satisfactorily. A large garden syringe may be used, but would take too long. A fine shower is what is wanted. You want two roses or nozzles, one for short and one for long distance. The ordinary pail of water is enough for a large-sized Apple tree. If heavy rain should follow as soon as the poisoned water is showered on trees, you will have to shower again. I have never known fruit to be hurt or any harm done by this, if used properly. The quantity is so small, and the time so long before fruit ripens, that every trace is lost. In an orchard where there are cattle, sheep, &c., it would not be wise to let them graze for a few days after showering the trees with poison. If left for hay, this will not hurt the hay.

"As to the time for showering, I propose the morning, when the leaves are dry, or any time when dry, as the sun absorbs the water, and mineral poison settles. If the water is not sunned to near the same heat as the surrounding atmosphere, make a small fire and heat a few bricks before using, and temper the water in a tub, use a thermometer, and heat water to same degree as atmosphere. This is very important.

"Paris green is an arsenical poison. To shower when in bloom may do harm, and destroy bees. London purple, or arsenite of lime, is about equal to Paris green, and used the same way. Both are poisons, and should be used carefully. I recommend those that use one to use the other, and test them on separate rows of trees. Paris green or London purple costs here 1s. to 1s. 3d. per pound. This is

the cheapest and most effectual way to destroy the pests by actual tests. As the young grubs eat a small part of leaf or fruit, a very small particle of this poison will kill, and save a great percentage of the fruit crop. I have used Paris green eight years, London purple two years, on fruit and vegetables." *Enoch Hoines in Evesham Journal.*

LINNEAN SOCIETY.—The Society met on March 6, Mr. CARRUTHERS, F.R.S., President in the chair. Mr. S. LINDGREN was admitted, and Messrs. J. LANE, E. R. WAITE, and G. F. ELLIOTT were elected Fellows of the Society. Mr. THOMAS CHRISTY exhibited a dried specimen of *Picramnia antidesma*, the plant from the bark of which medicine known as Cascara amara is believed to be prepared, and which is a useful alternative in diseases of the blood and skin. A paper was read by Mr. D. MORRIS on the production of seed in certain varieties of Sugar-cane, the *Saccharum officinarum*. It was pointed out that, although well known as a cultivated plant, the Sugar-cane had nowhere been found wild; nor had the seed (caryopsis) been figured or described; it being the generally received opinion that having been propagated entirely by slips or cuttings, it had lost the power of producing seed. Spikelets, however, received at Kew, had been carefully examined and the seed found which was now for the first time exhibited by Mr. MORRIS. He anticipated that by cross-fertilisation and selection of seedlings, the Sugar-cane might be greatly improved, and much importance was attached to the subject, as it opened up a new field of investigation in regard to Sugar-cane cultivation. Mr. J. G. BAKER and Mr. CHRISTY concurred. A paper was then read by Mr. SPENCER MOORE on "The true Nature of callus: Part I. The Vegetable Marrow and *Ballia callitricha*." It was shown that the callus of sieve-tubes of the Vegetable Marrow gives marked proteid reactions, and since it is dissolved in a peptonising fluid, there can be no doubt of it being a true proteid, and not a kind of a starchy mucilage, as is usually supposed. The "stoppers" of *Ballia* also yield proteid reactions; but as inasmuch as they resist gastric digestion, the substance cannot be a true proteid, and may, perhaps, be allied to hordacein. Mr. MOORE maintained the view of RUSROW, STRASSBURGER, and others, that callus is deposited upon the sieve, to be correct in the case of the Vegetable Marrow, since a peptonising fluid clears the sieve-plates, and leaves them in their pristine condition, which would not be the case if callus were formed by a swelling up of the sieves. A discussion followed, in which Dr. F. W. OLIVER, Dr. D. H. SCOTT, Professor REYNOLDS GREENE, and Mr. GEORGE MURRAY took part.

WILDSMITH MEMORIAL FUND.—In aid of the above Fund, the following sums have been promised:—

	£	s.	d.		£	s.	d.
The Hon. Emma L.	Miss Potts
Shaw Lefevre	5	0	0	Miss Markby
John Hargreaves	Mr. W. Bander
Esq., J. Palmer, Esq.	5	0	0	Mr. H. J. Clayton
J.P.	5	5	0	Mr. W. Coleman
Messrs. Sutton & Sons	5	5	0	Mr. W. Crump
Mr. A. W. Sutton	5	0	0	Mr. A. Dean
Messrs. J. Veitch & Sons	5	5	0	Mr. W. C. Davis
Mr. H. J. Veitch	1	1	0	A Friend, No. 1
Mr. F. G. M. Verdel	0	19	6	A Friend, No. 2
F. B. Mason, Esq.	Mr. S. Kerry
J.P.	2	2	0	Mr. A. Maxson
G. F. Wilson, Esq.	Mr. W. A. Searing
F.R.S.	1	1	0	Mr. T. Turton
				Messrs. W. Wood & Sons

Hon. Secretary, Mr. T. TUCSON, Maiden Erlegh Gardens, Reading. Hon. Treasurers, Mr. A. W. SETTON, Reading; and Mr. H. J. VEITCH, Chelsea.

DRIED FLOWERS AND THE INFLUENZA.—From our contemporary, the *Chenist and Druggist*, we gather the following items:—First, that one of the effects of the recent epidemic has been a considerable consumption of dried flowers popularly used for infusions, such as Borage, Corn Poppy, Marsh Mallow, Coltsfoot, and Linden tree flowers. The supply in stock, it is said, has run very low, and none

TAXODIUM DISTICHUM AT SYON.

can be expected before the coming season. Second, that with reference to the supply of camphor, the demand for which has much increased of late, that the mail reports from Hong-Kong state, that 250 piculs of Formosa camphor had arrived there, and had been shipped to Europe. It is further asserted that the quantity of camphor used in the manufacture of smokeless powder is exceedingly large, and that it enters into the composition of that article to the extent of 10 per cent. of the weight. In consequence of this there are now no old stocks, the manufacturers being compelled to refine the fresh arrivals, thereby losing about 5 per cent. on the weight.

"MANUAL OF THE BOTANY OF THE NORTHERN UNITED STATES."—We announce, with great satisfaction, the publication of the sixth edition of a book which is not only indispensable to botanists, but most serviceable to growers of hardy plants. The original work was constructed by the late Professor ASA GRAY, this present edition being revised and extended by Mr. SERENO WATSON, Dr. GRAY's associate for many years; Professor COLLETER, and others. All the newer discoveries are included, the Il-paticæ are inserted, and specially the limits are extended westward to the 100th meridian, where it connects with Professor COLLETER's *Flores of the Rocky Mountains*, which in its turn impinges on the Flora of California. Many Canadian species are necessarily included, and the Dominion is otherwise provided for by *Mason's Catalogue*, so that now we have a pretty complete Flora of the North American Continent east of the Mississippi and north of Carolina and Tennessee. The number of plates has been increased, and an excellent index provided. Criticism on points of detail might, no doubt, be indulged in if it were worth while, but the botanist will feel much too deeply the value of the work as a whole to trouble about minor points on which difference of opinion might be entertained.

RURAL ECONOMY.—In February, 1884, Dr. J. H. GILBERT, F.R.S., of the Rothamsted Laboratory, was appointed by the electors of Oxford University to the Suburban Chair of Rural Economy, the stipend of which is £200 per annum, and is tenable for three years. At the end of the three years Professor GILBERT was re-appointed for a second term of three years, which he brings to a conclusion during the present week. This final course of lectures, which closes on Friday have been on the 'Sources of the Fat of the Animal Body,' 'The Produce and Composition of Milk from Dairy Cows,' and 'Animal Food and Manure,' illustrated chiefly from the investigations at Rothamsted.

BULB SHOW AT HAARLEM.—From March 21 to 25, inclusive, the large quinquennial show of flowering bulbs and tubers, will be held at Haarlem, especially of Hyacinths, Tulips, Narcissus, and Anemylis. The show is under the auspices of the General Union for the Cultivation of Flower Roots, and this year it promises to be a very fine one. It will doubtless be of great interest to foreign amateurs and horticulturists, whose visits will afford great pleasure to the Dutch bulb growers and their Society.

BRITISH FRUIT GROWERS' ASSOCIATION.—This Association, which is well calculated to do good service in promoting rational fruit culture, is about to appoint local secretaries in various districts to commission lecturers and demonstrators to visit different parts of the country, and to hold various conferences during the course of the summer. Mr. LEWIS CASTLE, Hotham House, Merton, is the Honorary Secretary.

GALANTHUS NIVALIS SCHARLOCKI.—Mr. MAX LEICHTLIN of Baden-Baden, kindly points out a mistake we made in our issue of March 1, p. 208, in spelling the name of the aspidopodrop. The plant was named by Professor G. FRANK, of Königs-

berg, in honour of the discoverer, Apothecary S. HARTLOCK of Graudenz, and in consequence, it should be Scharlocki and not Shaylori as we inadvertently put it.

THE MAYOR OF WORCESTER.—On the 5th inst. the foremen and clerks of the firm of RICHARD SMITH & Co., St. John's Nurseries, Worcester, to the number of thirty, were entertained at dinner by Mr. SMITH, the senior partner, in commemoration of his majority of the faithful city, this year. The company sat down to an excellent repast, and the evening was pleasantly spent.

BOTANIC GARDENS, GLASNEVIN AND OXFORD.—The list of seeds for exchange has been issued. The list, especially in the case of Glasnevin, is a very extensive one.

MESSRS. SUTTON AND SONS.—The New Zealand mails bring full reports of this exhibition, which bids fair to be a great success. "The largest exhibitors," says the *Otago Daily Times* of January 1, "in the British section are Messrs. SUTTON & SONS, of Reading and London, whose display was agricultural as well as horticultural, and included vegetables, grasses, flower seeds, and models of pulse, roots, &c., executed with great fidelity. The exhibit includes also a number of cabinets of seeds arranged for educational purposes."

DUTCH HORTICULTURAL SOCIETY. At the meeting of the Floral Committee of this Society on February 12, Messrs. E. H. KRELMAN & SONS, Haarlem, sent a *Narcissus tazetta* Grand Empress, but it not being considered an acquisition, a vote of thanks only was awarded them; a similar acknowledgment being made for a collection of bulb and tuberous plants. A commendation was made to the same firm for a collection of cut flowers of different varieties of *Heliozores*, and for *H. Becconi superbus*. A fine *Iris Bismarckii*, shown by the same firm, obtained a Second-class Certificate. First-class Certificates went to Mr. R. ZAANBOORDER, at Limmen, for a new Duc of Tholl Tulip, exhibited under the name of Cochenille Duc. This Tulip flowers, like the type, early in December; the colour of the flower is dark red, and the size is above the ordinary. Messrs. GROENHOEFEN & Co., of Amsterdam, received a First-class Certificate for *Clivia robusta* elegans, a plant of robust growth, with large well-shaped dark-coloured flower.

THE "BOTANICAL MAGAZINE." The March number comprises coloured illustrations and descriptions of—

Zamia Walpersii, a new Canadian species, with short trunk and broad plicate leaflets; t. 7103.

Satyria arabiana (L.) a handsome terrestrial Orchid, with large carmine coloured flowers. It has been introduced from the Cape through the mediation of Mr. O'BRIEN, and flowered in the Cape-house at Kew; t. 7104.

Ariseum Wrayi is a remarkable Aroid, with pedate leaves, and a greenish three-lobed spadix, beyond which protrudes a long, slender, drooping spadix, according to the custom in the genus. It is a native of the Malay peninsula; t. 7105.

Lathraea clandestina, the beautiful parasitical plant, grown with so much success at Kew, and figured in our columns, May 25, 1889, p. 653; t. 7106.

Papaver capifraga var. *atlanticum*, a Moroccan variety, with orange-scarlet flowers, each about 2 to 3 inches in diameter. Flowered in the herbaceous ground at Kew; t. 7107.

GHEENT CHAMROE SYNDICALE.—At the meeting on March 10, our special correspondent writes, that a *Cattleya Trianae*, with fourteen superb flowers, shown by Messrs. VERBAET & Co., obtained a Cultural Certificate; another *Cattleya*, *Reine des Belges*, received an Award of Merit by acclamation. A like distinction was conferred on *Colognye cristata* alba, a superb specimen of which was shown by M. JULES-HE, who also showed *Odontoglossum Albertinum*,

and received a similar award. The same exhibitor showed a fine *Odontoglossum* and a *Cypripedium macropterum*. M. AUGUSTA VAN GEERT obtained a Certificate of Merit for a pure white variety of *Cattleya Trianae*. A good variety of *Odontoglossum triumphans* from Messrs. VERBAET & Co. was awarded a Certificate of Merit, and a like distinction was accorded to Madame la Marquise de WARZIN, for *Angraecum Sanderrinum*, of a pure white colour, and exquisitely fragrant. M. GUILLELMO DE WALLE showed a superb *Clivia Van Houtte*, with six very large trusses; M. MOULIENS, a Seedling *Clivia*; Messrs. DESBOIS & Co., *Nantheoceras sorbifolia*; and JULES DE COCK, a fine form of *Cypripedium hirsutissimum* grande.

MR. VEITCH'S LECTURE ON HIPPEASTRUMS.—At the meeting of the Royal Horticultural Society on Tuesday last, the paper that was read by Mr. H. J. VEITCH on the origin of the *Hippeastrum* varieties raised at his nursery at Chelsea, was full of interest. Mr. Veitch gave a brief history of the various species of the genus, and of the experiments made by Dean HERBERT and others, in interesting these species. The early history of these crosses is given chiefly in the pages of the *Botanical Register* and in those of the *Journal of the Horticultural Society*. The introduction by PHAEBE of *Hippeastrum Leopoldi* was shown to have exerted the most potent influence on the modern forms. The first step towards a flower improved according to the ideas of the florist, he said, was obtained in H. GAYANA, a seedling of H. *Crecea grandiflora*. This was followed by crossing the former with H. *Brazilensis*, and the resulting flowers were *Empress of India* and others like it. The flowers were of good form, substance, and fine colour, but with much green colour at the base of the segments; and while the segments were much broader than had formerly held good of species and hybrids, there was no commensurate broadening of the lower one, and crosses were attempted in which these blemishes should not occur. To this end *Empress*, and the species *Ackermannii* and *Leopoldi* were crossed indiscriminately, and to-day we have the *Champion*, the finest crimson hybrid yet obtained. The cultural details given were those pursued at Chelsea, and which year by year give such beautiful flowers as may be seen there at this time of the year. These matters have been fully detailed in our pages from time to time.

NARCISSUS POETICUS.—Mr. HARTLAND, writing on March 10, sends us flowers of *Narcissus poeticus* from the open ground near Cork. This is, we believe, the earliest period at which the flowering of this species has been recorded in the British Isles. From the same gentleman we received flowers of *N. maximum* from bulbs collected in Spain.

THE DAFFODIL CONGRESS AT CHISWICK.—We hear that it is likely that the exhibition on April 15, 16, 17, and 18, in the Gardens of the Royal Horticultural Society at Chiswick, will be opened by H.R.H. the Duchess of Teck, well known for her sympathy with horticulture. Professor FORSTER will probably read the opening address.

THE STRAWONISER.—We are informed by Mr. Strawson, to whom we applied for information, that Messrs. Hornsby & Sons, of Grantham, are manufacturing a small machine suitable for Kitchen and Flower Gardens as well as for fruit trees up to 25 feet in height. Such a machine will be a boon in market gardens.

FORESTRY.—A paper, entitled *Forestry in the Colonies and in India*, was read by Dr. W. SCULLICRAN, late Inspector General of Forests to the Government of India, at a meeting of the Royal Colonial Institute, held in the Whitehall Rooms of the Hotel Métropole, on Tuesday night, 11th inst., Lord Byron in the chair. The direct usefulness of forests, he said, in so far as they yielded timber or other produce, represented capital, and provided labour, depended upon many things, such as the means of communication in a

country and with other countries, the quantity and quality of substitutes for forest produce available in the country, especially iron and coal, the value of land and labour, and the returns which land yielded if used for other purposes, the density of population, and the amount of capital available for investment. The British Empire, although it was so frequently represented as possessing more extensive forests than any other nation, paid every year something like 12,000,000*l.* to foreign countries for timber alone. Here, then, was a broad fact which called for serious consideration, for under existing circumstances the imports of timber into the Empire would increase rather than decrease. There were certain reasons therefore, why State interference was more called for in the case of forestry than in most other branches of industry.

PODOCARPUS ACUTIFOLIUS (the Acute-leaved Totara) is an erect-branched shrub, from 3 feet to 6 feet in height, with pungent leaves. When growing in exposed places the branches are short and rigid, and the leaves close-set; but when in sheltered situations the branches are slender, with the leaves laxly arranged and spreading. Leaves green, three-quarters of an inch or more long, narrow-linear, coriaceous, pungent, making the plant very prickly to handle. The male catkins are about 1 inch in length, very slender, and may be solitary or in clusters of from two to five on a short peduncle. Female flowers solitary in the axils of the leaves. Fruit, a brown nut seated on a crimson pulpy receptacle. The flowers are produced in December and January, and the fruit is mature in April and May. The properties and uses of this species are unknown. *T. Kirk*, in "Forest Flora of New Zealand."

HUMEA ELEGANS.

This is a plant that one sees much less frequently in gardens now than some twenty-five years ago, and I am reminded of its grace and beauty by a photograph of a group, in a wild state, published in the last volume of the *Victorian Naturalist*. Early in the present century, in 1801, Sir James Edward Smith, the purchaser of Linnaeus' collections, and the founder of the Linnaean Society of London, started a new illustrated periodical, with the special object, as stated in the preface, of figuring plants not in cultivation in this country, though deserving the attention of cultivators and importers. This was, in a sense, an apology to the editors of the various existing periodicals devoted to the illustration of cultivated plants, for after all, the majority of the plants figured were already in cultivation though many were quite new to science, and described for the first time in Smith's *Exotic Botany*—a work that only ran to two volumes of sixty plates each.

The plant represented in the first plate was one of the many Australian novelties introduced about that period, and Sir James Smith named it in compliment to the lady in whose garden it first flowered in England. From its general appearance nobody would guess that it is a member of the Compositae, as it much more closely resembles some of the Amaranaceae; but it is one of the many instances in the vegetable kingdom of plants whose affinities can only be ascertained by an examination of the flowers. Indeed, it is so far different from the great majority of the Compositae that the flowers, or florets as they are sometimes called, are usually solitary, and the showy part of the inflorescence consists of scale-like coloured bracts enclosing the solitary flower. Unlike most members of the family, too, these bracts increase in size upwards, the lowermost ones being very minute, whilst the upper are relatively large and showy.

Smith says:—"Specimens of this elegant plant have long since been sent to England from the neighbourhood of Port Jackson, New South Wales, but its appearance was altogether so new and extraordinary, that no botanist could determine its genus, or even its natural order. Its proper class in the

Linnaean system was not suspected till the summer of 1804, when Lady Hume, fortunately, had several plants in blossom in her choice collection at Wormleybury, Hertsm., from seeds communicated by the Right Honourable Sir Joseph Banks. The beauty of its wide-spreading, drooping panicle, and innumerable shining rose-coloured flowers (bracts), which sometimes vary to white, render this plant a great acquisition to the greenhouse, in which it succeeds without any peculiar attention. It is moreover desirable for its fragrance, which, though much too strong in the leaves, partakes in the panicle of the odour of the Hantboy Strawberry, with some resemblance to the Cedar-wood."

Much more might be said now of the value of *Humea elegans* in the open bed or border in the summer, but it has been repeated often enough, and is probably better known and understood by many others than the writer of this note, whose only object is to direct attention to an old favourite.

The photograph of a wild group of this plant, alluded to above, accompanies the narrative of a trip to Croajlong in East Victoria, Australia, by Professor Baldwin Spencer and C. French, F.L.S. This is a hilly, still almost uninhabited district, rising in its northern part, bordering on New South Wales, to 3700 feet, not far from the locality in which the *Humea* was found in unusual luxuriance. The aspect of the plants in the very much reduced photograph is that of a number of persons draped in white from the head, and standing above the luxuriant Fern vegetation, which is distinctly shown in the foreground.

The writer of the notice now in question describing the country where they met with the *Humea*, says, "The scene is a very fine one. Right in front the Coast Ranges, nearly 4000 feet high, block the way to the north; to the right rises Mount Bungwarri, peaked, and crowned to its summit with forest; to the left we are shut in by lofty white Gums running up the mountain-side; and beneath as the hill runs down steeply to the densely wooded valley. The track descends rapidly, and after an easy day's march of 9 miles we camp at the base of Goon Mark, the highest in this district, close by a lovely group of *Humea elegans*, in full bloom, some of them being from 15 to 20 feet high."

Imagine *Humea* 20 feet high, with its hanging plumes of slender graceful branchlets so dense that the camera shows them only as ghost-like masses of white.

The colour of the flowers, or rather of the bracts, varies considerably from white or pale pink to crimson, and I doubt whether the deepest coloured variety has ever been in cultivation. In the Kew Herbarium there is a specimen from the Victoria Ranges, which even in the dried is of a beautiful bright crimson. *W. Belling Hensley, One Ash, Casselbridge Road, Chislehurst.*

KEW NOTES.

AMORPHOPHALLUS TITANUM.—There is no truth in the report that the large plant at Kew of this gigantic Aroid died immediately after, and in consequence of its flowering. The plant is now in fine condition in the house where it flowered last year, the leaf developed since December measuring 14 inches in diameter at the base, and 9 feet in height. All the roots perishing soon after the flower had been removed, the tuber was taken out of the soil, washed, and then weighed. It had lost 7 lb. in weight from the time when it was repotted, about two months before it pushed up the flower to the time when the flower was past. Apparently there is no reason why this plant may not flower again next year.

Godwinia glans, which flowered at Kew last year, is again in flower there now. It will be remembered that previous to the discovery of the Titanic *Amorphophallus* by Dr. Beccari, the Godwinia was the acknowledged giant of the Aroidae.

Ariseaou speciosa is also represented by some very fine plants in flower, some of them having

larger and darker spathes than is usual in this species. Several plants of *Dracontium focundum*, a near relative of the Godwinia, and not unlike it, except that the spathe is smaller, are also flowering in one of the stoves.

Tuccarum Warningianum, another large-flowered Aroid, related to the *Amorphophallus*, is pushing up a fine inflorescence. In the Cape-house there are some very large spathes of several species of *Sauromatum*. *W. W.*

FROST AT LA MORTOLA.

THE neighbourhood of Ventimiglia, and especially the gardens of Mr. T. Hanbury at La Mortola, have been visited by sharp frost, and a heavy fall of snow, the frost prevailing for several nights. Such weather has not been known here for the last seven or eight years. With about 500 species of plants in flower, and large numbers of tropical and semi-tropical plants in all parts of the garden, I fully expected to see very great havoc, especially as the sun shone out in the middle of the day with all the brightness common in the Italian Riviera. Having spent a couple of days noticing the effect of the frost on the vegetation, I was more than surprised to find so very little damage to the plants. *Begonia* of the several species cultivated in these gardens are badly cut up, the soft, succulent leaves being amongst the first to collapse. Next to the *Begonia*, the *Salvias* have felt the frost the worst, especially those in any exposed position; but even here it is merely the outside shoots that are destroyed, and there are many plants of this genus flowering away again as gay as ever.

Ferdinandia emimens, *Clerodendron fragrans*, and several species of *Wigandia* have suffered in the young leaves. The genus *Lochroma* is rather puzzling in respect to its frost resistance; *L. tubulosum* has escaped with very slight damage, whilst *L. coccineum* has lost all its leaves. This latter plant presents a marked contrast to a huge bush of the double form of *Sparmannia africana* in full flower, which is uninjured, the *Lochroma* has its branches intermixed with those of the *Sparmannia*, and so the contrast is the more remarkable. Can it be that the dense pubescent leaves of the latter plant are more capable of resisting frost?

In another part of the garden, two other species show a marked contrast in their frost-resisting powers, these are *Cycas revoluta* and *Aralia papyrifera*, the latter plant has suffered very much, and the large tough leaves are falling; the *Cycad* has come through the frost as healthy and as glossy as ever. In both plants there is a similarity of texture, and a lanate development to protect the young growth. Here and there the shrubs of *Heliotrope* have been cut back, *Teucoma capensis* and *Bomarea oligantha* in close proximity are in full flower totally unaffected. *Linum trigynum*, *Bougainvillea spectabilis*, and *Canarina campanula*, show traces of the frost, especially the latter plant, but are flowering away as bravely as if they had not experienced several degrees of frost. Amongst the succulents—which are the glory of these gardens—there is very little damage indeed; *Kleinia viridiflora* and a large plant of *Agave attenuata* in flower are amongst the injured in this section. This immunity from frost injuries is the more noticeable from the fact, that the genus *Mesembryanthemum* alone is represented here by about ninety species, and the other genera of succulent plants in like proportion. The semi-aquatics have, with the exception of *Caladium esculentum*, escaped injury; this is interesting from the fact, that growing side by side are such plants as *Cyperus papyrus*, *Richardia thiopica*, *Philodendron pertusum*, *Bamboos* of several species, and *Azolla caroliniana*, *Canna indica*, *Cuphea emimens*, and *Dahlia Maximiliana* show unmistakable evidences of the frost; *Sretiliza augusta*, *S. regina*, and that lovely Cape plant *Othonna Athanasie*, in full flower, on the other hand escape.

The Solanums, many with soft young growths, have, as one might expect, received a severe check; nearly all the species were carrying fruit; this, except in the case of *S. betaceum*, appears to be sound and unaffected. *S. ciliatum* var. *macrocarpa*, one of the most ornamental of the whole genus, does not show any trace either in the rich scarlet fruits or the leaves.

With very few exceptions, the species injured by the frost are those which have made a winter growth, *i.e.*, new growth since the previous autumn; as for example, the Solanums and Salvias. These plants have continued to grow all through the autumn and winter months. Such growth has not undergone the changes due to the excessive drought and summer sun, influences that render vegetation less liable to injury by a few degrees of frost.

This hypothesis is, I think supported by the fact that Palms, Cycads, Eucalypti, Banksias, Oranges, Acacias, and a host of other plants, that would be injured beyond recovery if exposed to a few degrees of frost in a more northern climate—pass through a few degrees here, practically uninjured. *J. W. O'N.*, *Ventnorville, Belg., March 7.*

THE BULB GARDEN.

LILIUM AURATUM.

Few of the many roots imported from Japan survive the first season, the large crop of flowers usually produced being followed by a mass of stem-roots alone, which tend to the utter collapse of the bulbs, the few that survive being those which have emitted fresh roots at the base of the bulbs after planting. The great loss from decay on the voyage to this country is doubtless caused by sweating in bulk during the protracted voyage, may help to explain the cause of the loss of sound bulbs afterwards. I have asked myself the question why this particular species of Lily fails in so many instances to send forth roots at the base after importation; I mean those, of course, that survive the journey, and which seem fairly sound and plump when the cases are opened. Is it probable that the new basal roots were formed, but were cut off for the greater convenience of packing, prior to being embedded in the usual clay envelopment? If this be so, it is no wonder that a second lot of roots does not form, and that the bulb perishes. This, however, can hardly be the case with the earlier arrivals, and yet I have not observed that these are generally any better than those that arrive later, which makes it difficult to understand. The soil in which these imported bulbs are moulded before being packed, is of an adhesive nature, a fact which may not conduce to the health of the enclosed bulbs; in many instances it becomes quite a hard crust, rendering evaporation of moisture from the bulb well nigh impossible, and I incline to the belief that a decidedly lighter material, and dry, for packing purposes, with the use of perforated cases, might be found to answer perhaps better, the transit cost would be less, and basal roots, assuming these are already emitted, may then be left intact. A few importations would suffice to prove which of the two methods was the better. But, after all, it still remains a significant fact that some Lilies suffer to a greater extent than others during transit; for example, the varieties of *Lilium speciosum* and *L. longidorum* arrive in better condition as a whole than *L. auratum*, while of the latter group the varieties *platyphyllum* and *virginale* come to hand in better condition, and do much better than the type; and *L. Krameri* suffers considerably, as do *L. auratum rubra* and *L. a. vittatum*. In potting newly imported bulbs the moisture contained in the soil will be ample for their needs for a time, and the bulbs should be plunged 4 or 6 inches deep in fine coal ashes or cocoa fibre in cold frames, or under some kind of protection that will keep off rain. Here the bulbs should remain until a few inches of growth has been made, and they should be examined closely for decayed portions before being potted.

Where it is found that portions only of some scales are attacked, and particularly where these are not the outer scales, the decaying part only should be broken off, and charcoal dust sprinkled over the wound, which may have the effect of staying the spread of decay. The loss of a few scales, however, is not a very serious item as compared with the state of the base of the bulbs, as it is here that the mischief lies, and this fact has for some time led me to believe that the bulbs themselves have been subjected to a mutilating process. It should be stated in regard to Lilies generally that they do not require much shade, and some of the finest clumps of Lilliums I have seen, while being shaded about their roots, were permitted to send their flower-heads up into full sunlight. *J.*

MONTEBELLAS.

The varieties of these plants have received effective and valuable additions of late years that are of service for decorative purposes for cut flowers. The spikes are graceful, and the flowers bright. For cut bloom, the best way is to grow them outdoors, they being nearly hardy, and the most suitable place is a narrow border alongside of a sunny wall, or front of the greenhouse. Here they should have a good depth of light rich sandy soil, and be planted 6 inches deep, the right time for doing this being the present, before the bulbs or roots start; and after the planting is done, it is advisable to scatter a few half-rotten leaves, or Cocoa-nut fibre over the top. Once planted, they require no further attention beyond the autumnal top-dressing, to protect them against severe frost. *J. S.*

SUBTROPICAL BEDDING PLANTS.

PROVISION should be made to raise a stock of plants for the decoration of the subtropical garden. I propose to name some of the most useful in this respect, the best means of raising a stock, and also add a few suggestions as to the planting of each. *Acacia lepantha* is easily raised from seed, sown in sandy soil in March, on brisk bottom-heat, the young plants grow quickly, and 4-inch pots are large enough for them previous to planting them. They should be allowed to grow with one upright stem. The finely cut leaves render this *Acacia* suitable for "dot" plants or mixing with other foliage or flowering subjects.

An effective arrangement where this plant is needed to form a mass is to plant it at about 14 feet apart, and fill in between with *Perilla nankinensis*, and by pinching the latter frequently the plants could be kept below the side branches of the *Acacia*, a very pretty effect is produced in this manner.

Grevillea robusta is best grown with a single upright stem, and its light feathery drooping leaves making it a very effective "dot" plant amongst Alternantheras or other dwarf plants. The seed should be sown at once on a gentle bottom-heat; the plants the first year will grow about 1 foot high and some of them rather more. If these are carefully lifted in the autumn, and potted and placed in a cool house for the winter, fine plants will be available for the next year that will be better adapted for mixing with tall plants than the young ones of this year. This *Grevillea* gives a good effect if planted in a mass and carpeted beneath with dark flowered Violas.

Abutilon Thompsonianum with its green leaves, golden blotched, is showy as a single plant, or three or five together, growing with others which harmonise with it in colour. For any purpose it is best grown with a single stem, and to effect this cuttings should be put in during September, four or five in a 3-inch pot, in which they soon root. These should be wintered in a cool house, and potting them oil singly in March, all the while keeping them cool. Cuttings from old stock plants may be taken off during March—these are easily rooted in bottom-heat, and make nice plants by the middle

of May; side branches will form during the summer. Whether these are removed or pinched at the first or second leaf is a matter of no moment, but in any case the leader should be kept intact; free growth should be encouraged, as the markings on the leaves are thus rendered more effective.

Ricinus in variety, are much in request in some places, a well-grown plant having a fine appearance. *R. Gibsonii*, of a dark coppery colour, grows about 5 feet high, but may be kept to 3 feet by timely pinching out of the points of the shoots; *Cambodensis* is another of the dark-leaved kinds, and capital plants 2 feet high may be obtained, rendering it available as a nice "dot" plant to put amongst light coloured Violas. *R. communis* or *sanguineus* has green leaves, and is effective when planted in a mass in the centre of a circular bed; for instance, having next to it a row of *R. Gibsonii*, finishing off in front with a row of *Solanum marginatum*, the colour of these two plants harmonising thoroughly. At the end of March or April is time enough to sow seeds of *Ricinus*, which should be done singly in small pots, standing them in ainery where some heat can be given them, afterwards potting into 5-inch pots supplying the roots with abundance of water when well-rooted. The mistake in the growth of *Castor-oil* plants is sowing the seed too early, the consequence is, that long before the time for putting them out arrives, the pots are full of roots, which get sometimes very dry, the leaves turn yellow, and eventually fall off, the plants are then leggy, and have a poor appearance. At planting time they should not be more than 1 foot high, and have all their leaves intact down to the soil.

Melianthus major is useful to plant singly in the centre of a small bed, or in a mass in a larger one, and can be grown with a single stem, or in a branching manner. The glaucous leaves have a blue tint which adds to the effectiveness of the plant. Sow the seed at once in sandy soil on a gentle bottom-heat. If larger plants are wanted keep some of them in small pots during the summer and winter giving them a larger shift early in the spring to increase free growth.

Jasanda mimosa-folia is a capital subject to grow as a "dot" plant for carpet-beds, its finely cut leaves have a light appearance, and the deep green colour of which associates well with almost any undergrowth. Cuttings inserted in a gentle bottom-heat in February quickly root, and grow into nice little plants by June; if larger are needed, they should be grown on in the cool greenhouse for a season, which will give them not only extra size but robustness.

Solanums are valuable annuals for the subtropical garden, as they can be grown to a large size in the same year from seed. *pyramanthum* has leaves not more than 2 inches wide, are long and semi-drooping, of a bronzy shade of colour. The long spines with which the leaves are covered, both on the upper and lower surfaces, render it attractive, placed where each plant will show its leaves clearly—that is, thinly in a mass in one bed, or as "dot" plants. The seed should have been sown about the middle of February. *S. argenteum*, or *marginatum*, grows in good soil, 3 to 4 feet high; the stems and leaves are silvery. Nowhere does this sort show to better advantage than when placed in the neighbourhood of dark-leaved *Castor-oil* plants. From the beginning to the middle of March is soon enough to sow the seed of this variety and *S. robustum*, as they both grow quickly, and are liable to get stunted in growth in the pots before planting time, if sown sooner. The last-named sort is the strongest growing of them all, producing large leaves bronzy-green in colour.

Eucalyptus globulus is generally appreciated for its deep glaucous green foliage, the perfume of its leaves, and rapid growth. A mass of it in the centre of a bed looks well, or mixed with other plants. It is time to sow the seed, the plants being grown on in ainery for a while, until well established.

Dracena indivisa as a "dot" plant is one of the best subjects we have. From the rootlets taken from the base of old plants in the spring nice strong

plants are obtained, if kept growing for a year in the greenhouse before planting them out.

Wigandia caracasana is a plant of dwarf growth, with very large leaves, dark green in colour, and which looks well on the outside of a bed where there is abundance of space to develop in. The middle of March is time enough to sow seed.

Salvia argentea is a plant that does not grow more than 1 foot high, and produces leaves as much in width, which are covered with silvery-white tomentum, which gives the plant a striking appearance when covered with drops of dew or raindrops. Planted alternately with the green fishbone *Thistle* as an edging to other subtropical plants, a pretty effect is produced. The middle of March is soon enough to sow the seeds.

Cannabis gigantea (common Hemp), is a coarse growing plant, and is fit only for the rough parts of the garden. It will grow in one season as much as 12 feet high; strong well-manured soil is required for it, especially where the situation is a moist one—sow in April.

Cannas are largely employed for the decoration of the garden, some few are attractive as flowering plants, but the bulk of them are admired for their foliage, which in some varieties is marked in stripes of a dark colour. When once a stock of plants is secured, little trouble is needed to keep up the stock. Early in October, the roots should be dug up and packed away in soil in a cellar or frost-proof shed, like Dahlias. Early in March, the roots may be divided, placed in either pots or boxes, given a little heat to start them into growth, and when rooted, cooler treatment is necessary to render the leaves firm, as they sometimes are disfigured by winds if the plants have been grown in heat for too long a time.

Chamaecyparis Casabona and *C. diacantha*, the green and the white leaved fishbone *Thistles*, are effective plants where dwarf plants are needed as edgings to taller plants. The white leaved *Diacantha* variety is largely employed in some gardens, planted singly in beds which are carpeted with *Alternanthera* or other low growing plants. It is too late to sow seed, February being a better time. S.

THE FLORA OF QUEENSLAND.

In his report Mr. Bailey says:—"The results of the expedition to Wooroonooran, from a botanical point of view, have proved highly satisfactory; about thirty fresh plants have been added to the known flora of Australia, equalling in number those added to the flora of New Guinea by Sir William Macgregor's late expedition to the Owen Stanley Range, which is 8000 feet higher than Bellenden-Keer, and proportionately extensive in area. It being winter, a large number of the trees and shrubs were without flower or fruit, consequently could not be identified."

The whole range is clothed in dense tropical jungle from base to summit, there not being a single open space 50 feet square, except a patch of Ferns on the south spur at 2700 feet, and a few hundred yards of forest on the west spurs of Mounts Sophia and Toressa. Among the specimens collected were 110 different species of Ferns and twenty-six different Orchids. We found thirty-eight species of edible fruits, some of them very nutritious and of very agreeable flavours. The choicest of them will yet be cultivated, and run a close competition for popularity with the best of our civilised fruits. Among them is the *Citrus inodorus*, or scentless Lemon, named by Bailey, a tree with rich, dark-green foliage, bearing a fruit the size of a small Lemon, with a sharp, agreeable, acid taste, and very refreshing. We also found *Acronychia acidula*, or *Scortechini's Crab*, a form of which is found on the Logan, where attention was called to its usefulness by the late Rev. Father Scortechini. Among the smaller fruits were five species of native Grapes belonging to the genus *Vitis*, the wild Tamarind, two *Quandongs*, called *Curroogi* by the blacks, the *Burdekin Plum*, *Bomban* and *Rancooran* of the natives; five species of edible

Bears, six Nuts, three Cherries, one Blackberry, one Raspberry, one Loquat, four Figs, one Goebung, and one Nutmeg. None of the large fruits were available except the Mangosteen, as the superb specimens seen on my first ascent in February belong to the summer months. We found the Herbert River Cherry, *Antidesma dallachyanum*, heavily laden with ripe fruit, which is pleasant to eat in the raw state, and can be turned into excellent jam or jelly. There also in great abundance was *Davidsonia pruriens*, or *Davidson's Plum*, a blue-black Plum the size of a duck egg, the interior a rich bright purple juicy pulp, a sharp acid, very pleasant flavour, a remarkably refreshing fruit, with the happiest effect in assisting digestion. It is a great favourite of the cassowary, who marches round daily to pick up the fallen fruit.

Principal of the Nuts is the *Cia*, a round, clean Nut, as big as the largest Walnut, growing on a tree which attains an immense size. This Nut is often confounded with the *Coi*, a small red fruit growing on a Climber, and eaten by the Blacks after cooking on hot stones. In the first the accent is on the *o*, and in the second on the *i*. The *Cia* is eaten raw, and is a palatable and nutritious fruit. The natives regard it with special favour. The Loquat, known as the *Cooktown Loquat*, *Rhodomyrtus macrocarpa*, is an edible red juicy fruit, eaten with gusto by all the frugivorous birds. One of the

FIG. 59.—CHERRY & SEED, MOUNT BOLDUC. (SEE P. 321.)

Eugenia (corniflora) bears all along the trunk a large pink and white fruit, called *Murroo* by the blacks, who eat it occasionally, though rather spongy and insipid. Another *Eugenia (oleosa)* bears a lovely bright blue fruit, that would have a charming effect in the decorations of a banquet-hall, or ballroom, or evening party. The *Helicia Whelanii*, named by Bailey after Sergeant Whelan, bears a large Nut, extensively used for food by the blacks, in whose camps we found the shells or whole Nuts in considerable quantities. It is roasted and eaten without any maceration in water, apparently containing no poisonous principle. Chief of all the fruits is the *Garcinia Mestoni*, or *Meston's Mangosteen*, already described in a previous article. Mr. Soutter, of the Acclimatisation Gardens, is now trying to germinate the seeds of this and two other large fruits, at present unnamed, as only the seeds were found on the recent expedition. The true Nutmeg grows everywhere in abundance, and forms the favourite food of the Straits pigeons when down for the breeding season. It is smaller than the Nutmeg of commerce, but exactly the same in all other respects. Botanically the name is *Myristica inispida*.

All over Australia are palatable wild fruits, many pleasantly scented flowers, and birds that sing or whistle as sweetly as any in the world, the nightingale alone excepted.

Nearly all the flowers of the tropic north are perfumed, some of them diffusing a delightful odour,

The *Dracophyllum* of Wooroonooran bears one of the most magnificent flowers in the world. Some of the Orchids bear deliciously fragrant flowers, and on the summit of the mountain is a handsome shrub bearing a small white flower, with a fascinating scent, such as I never met with before.

Among the perfume-bearing plants is the *Orites fragrans*, named by Bailey, who describes it as "a most attractive plant, from the rich colour and fragrance of the inflorescence." The same sentence applies exactly to one of the *Hollandias* found on the mountain, according to Bailey, "a most desirable tree for garden culture." One very handsome tree is named *Cyanoecarpus Nortoniana*, after the Hon. A. Norton. The peculiar dome-topped tree, so often referred to in previous articles, is named *Leptospermum Wooroonooran*. Strange indeed if this extraordinary tree is found nowhere in this world except on the top of that mountain, the sole survivor of an ancient race. From the crest of *Earle Frere* comes *Melicope Chooreechillum*, a small tree bearing a thick white flower. The Queensland climbing bamboo, named *Bambusa Moreheadiana*, after the present premier, is a most imposing plant, ascending to the tops of the tallest trees, crossing over to others, and hanging in splendid festoons of leaves 10 inches long and 2 inches wide from the overarching spaces. It is found in the densest and richest scrub. Some idea of the size of this splendid plant can be found in the fact that it attains a length of over 200 feet. Among the large trees of that district is the *Ficus colossa*, or *Colossal Fig*, a tall, handsome tree with straight, smooth, bright green trunk. From the enormous flanges of this tree, called *Macorac*, the blacks cut their shields, and when dry it is tough and light, and stands a surprising amount of wear and tear. This is a favourite tree for the nests of the *Calornis metallica*, or bright metallic starlings, which build like the *Baltimore oriole*, and hundreds of these huge nests on one tree give it the appearance of having stopped a haystack flying round in a cyclone. On all the creeks up to 1200 feet we saw the *Umbrella Tree*, *Brassia actinophylla*, in magnificent perfection, with rich crimson flower-spikes 4 feet in length.

Among the 110 different Ferns are some stately and splendid specimens, and others small and delicately beautiful. Of the Tree Ferns, one of the handsomest has been named by Mueller after some damsel or matron called *Rebecca*. Hundreds of this glorious Fern were destroyed in cutting our tracks. The summit of Wooroonooran is the sole Australian habitat of the *White-leaved Bristle Fern*, found here for the first time. At 4000 feet we got the *Wig Fern Tree*, hitherto found only in South Africa, Brazil, and Java. There also is the lovely *Hairy Fern*, known previously only by a single frond obtained on the east side of *Mount Toressa* by *Walter Hill* in 1873. We saw *Tree Ferns* over 40 feet in height, said by Mr. Bailey to represent a great age. Among the new Orchids were *Oberonia pusilla* and *B. Toressa*, the latter named after my first-born, one found at 4000 feet, and the other at the *Whelanian Pools*, both flowering in June and July. Many of the Orchids were in flower, beautiful blossoms diffusing a rare fragrance, conspicuous among them being *D. speciosum*, summit of *Charroo'in*, and *Bailey's Orchid*, which was flowering in splendid perfection at the *Morehead Cataracts* and *Francesca Falls*. The Orchids and Ferns seen in our gardens and summer-houses bear the same resemblance to their wild brethren of the hot moist tropic jungles, that a caged eagle with half his tail gone, a foreclosed mortgage on his feathers, and a bilious headache, bears to the noble bird sweeping through the sunlit fields of air in all the glory and perfection of unfettered freedom.

Among the plants becoming naturalised and growing wild in that district are the *Pa-paw Apple*, *Grandilla*, *Apple Guava*, *Red Pepper*, *Citron*, *Passion Fruit*, *Tomato*, *Tobacco*, *Castor Oil*, and many grasses. Among the fibrous plants is one called *Boorogy* by the blacks, a ground plant with radiating, long, narrow leaves extending to 3 feet in

length. The leaves are about 2 inches wide, tapering to a point, and one of them would suspend 100 lb. The blacks use the leaves as rope, twist a couple into a band, and carry surprising loads, the weight all bearing on the band passed round the forehead. Of course only the skull of a myall or an alderman will submit to such a formidable strain. The botanical name is *Gymnostachys aneeps*, a title about as tough as the plant. It was found on Chooreechillum up to 4000 feet. Among the large trees were Stavewood, Red Beech, Red and White Cedar, Tulip, Ivorywood, Bean tree, Red Sandalwood, Blue and Gray Gums, Bloodwood, Moreton Bay Ash, Box, Leichhardt, Beefwood, swamp and forest Oaks, stringy-bark Pine, Damara and Kauri and She-Pines, and many giant trees not yet known or described, the local names of which are only misleading to the inquirer.

We found several plants known in other countries to possess more or less valuable medicinal properties, one of them being the Indian Wild Taro, the tubers of which are used as a potent fomentation in rheumatism. Among the Canes are the Midgen, and the large and small lawyer Canes, called "Yaplum" by the blacks. There were some magnificent Palms, two of them with leaves from 10 feet to 20 feet in length. We got over thirty specimens of grasses, some exotic and some indigenous. *The Queenslanders*, December 21, 1889.

THE LATE MR. WEBSTER,
GORDON CASTLE.

We take the following account of Webster's life from the *Banffshire Journal* of March 11, which in its turn copied the account, based on information supplied by himself, which appeared in the *Gardeners' Chronicle* of April 21, 1875:—

The announcement of the death of Mr. Webster, gardener, Gordon Castle, which occurred on Tuesday evening, will be received with feelings of deep regret by many in a wide district of country who held his name in high respect. Only a fortnight ago on Friday last, Mr. Webster presided at a meeting of the members of the local Horticultural Society. He caught influenza, which was epidemic in the district. For some time he had not been in very robust health, and the weakening malady proved too much for his impaired health.

Mr. Webster was born on December 8, 1814, at Blarner, a small and beautiful estate on the banks of the Whittader, one of the lower tributaries to the Tweed, in Berwickshire, where his father was then gardener to General Balfour, the proprietor. In the autumn of 1817 his father went to Manderston, about 3 miles distant, as gardener and general manager on the estate, in the service of General Maitland, father of the Earl of Lauderdale. Mr. Webster received his education at Duns, and having early formed a taste for gardening, was placed shortly after he was thirteen years of age to do light work in the gardens for three or four months during summer, when he again returned to school. He continued to do this until he was sixteen, when he went into the gardens for regular employment, with the object of making horticulture his profession. At Manderston Mr. Webster learned his profession in an excellent school. Grapes from the gardens gained several prizes at the shows of the Caledonian Horticultural Society in Edinburgh, and the awards, consisting of silver plate, are still heir-looms in the family. Mr. Webster left home about the age of eighteen, and went to Dalquharran Castle, in Ayrshire, as journeyman, under Mr. David Dick, and remained there until November, 1833, when he went to Whittinghame, in East Lothian, under Mr. William Rintoul. He derived considerable advantage during his services here from his having to assist in the laying out of a new flower garden, of which he had the principal superintendence. He was three years at this place, the last one as foreman. In November, 1836, he went to Claremont in Surrey, as foreman in the houses of the fruit department, under Mr.

C. McIntosh, author of the *Practical Gardener*, who was then in the service of the King of the Belgians. From Claremont, all the Grapes and Pine-apples had to be sent during the summer and autumn months for the supply of the Royal table at Lacken. In February, 1838, Mr. Webster went to Earsham, Sussex, as gardener to the Hon. Mrs. Huskisson, widow of Mr. Wm. Huskisson, M.P. for Liverpool, who was killed at the opening of the Manchester and Liverpool railway. His employer was a great admirer of Orchids, and during his long stay there, which was upwards of twelve years, Mr. Webster had an opportunity of getting together a choice collection. He was here successful in getting that shy flowering Orchid, *Renanthera coccinea*, to produce five large flower-spikes for a number of years in succession. In November, 1844, Mr. Webster was awarded a silver Banksian medal for one sent to the Horticultural Society's meeting in Regent Street, while two years later he had again a similar award for another spike which was one of five borne on the plant at the same time.

John Webster

Mr. Webster was also in possession of a gold Banksian, received for six Orchids shown at Chiswick, in June, 1847, having been placed first out of seven competitors. These were the only occasions on which he competed in London.

Mr. Webster next engaged with the late Duke of Richmond to take charge of the gardens and forests at Gordon Castle. Mr. Webster came to Gordon Castle on November 30, 1849. One of his first duties on his arrival there was to lay out for the Duchess a new flower garden in the Italian style, which had at that time been commenced. While carrying out the work of the flower garden in an altered design, and completing it in its present form, which was the work of a number of years, Mr. Webster had the assistance of the late Sir Joshua Jebb, C.E., and also the guidance of the good taste of the Duchess, in deciding upon plans for the balustrades, fences, fountain, and ornamental work. The balustrading springs from each end of the Castle, which is 540 feet in length, and encloses a space 300 feet in breadth. The ornaments on the principal piers are large classic dogs, and on the others are deer in a standing position, while, on all the intervening piers, are placed vases of different sizes and forms. At

Gordon Castle the gardens are about the most extensive, and it may be said with truth, among the prettiest in the North. The flower garden and the kitchen garden together extend to many acres, the latter alone covering 12 acres, and are a monument of the fidelity to duty and of the exercise of the best taste of a life-time. Mr. Webster lived the life of an ideal gardener. In constant contact with Nature's works, and daily increasing knowledge of her hidden marvels, Mr. Webster loved the profession with his whole heart, and his erudite acquaintance with flowers and plants placed him in quite a unique position in the North of Scotland.

Mr. Webster was an acknowledged authority in many departments of his profession. He was a frequent contributor to the recognised horticultural organs in the press, and his opinions were received with the weight attached to the utterances of men of skill. The results of interesting experiments which he made, or information as to the development of plants whose characteristics were little known, have frequently appeared in our columns. Only a few weeks ago an interesting item in horticulture appeared from his pen in the *Gardeners' Chronicle*, in whose pages were often found articles of the most interesting and useful nature over his signature. As a judge at flower shows, Mr. Webster was in great request, and his judgment was received as one of indisputable authority. Last year he devoted a good deal of attention to the cultivation of Plums, in the profitable propagation of which he took a lively interest. As a hybridiser, Mr. Webster was particularly successful, and especially so with hardy fruits. At the Edinburgh Congress, in 1880, he had a collection of forty varieties of Plums of his own raising, which were highly praised by the judges, and most favourably noticed by the horticultural press. Some of his seedling Apples are now standard varieties—Beauty of Moray and Northern Dumpling being greatly in demand. There is also a seedling Grape which gives every promise of becoming an excellent and useful fruit. With Mr. Webster herbaceous and alpine plants were also a speciality.

The community of Fochabers will greatly miss Mr. Webster's kindly presence. In movements having for their object the promotion of the social and intellectual welfare of the people, he took the deepest interest. A faithful servant in every respect, Mr. Webster was uniformly a just and upright master to those whom circumstances had placed under him. In him the Duke of Richmond and Gordon had lost an intelligent and faithful servant; Fochabers has lost a kind and helpful neighbour, and those under him an upright master. Mr. Webster is survived by Mrs. Webster, and by three sons and two daughters. Mr. Webster's remains were interred in the churchyard of Bellie on Friday.

LIST OF GARDEN ORCHIDS.

(Continued from p. 257.)

LILIA.

- (9.) L. DIGBYANA, Benth., in *Journ. Linn Soc.*, xviii. (1881), p. 314; Benth. and Hook. f. *Gen. Plant.*, iii., p. 531. *Brassavola Digbyana*, Lindl., *Bot. Beech.*, xxxii. (1846), t. 33; *Fl. des Serres*, t. 237; *Bot. Mag.*, t. 147; Warn. and Will. *Orch. Alb.*, vi., t. 241. *Botica Digbyana*, Rehb. t. in Walp., *Ann. Bot.*, vi. (1841), p. 122. British Honduras. First introduced into England in 1846, by Mrs. McDonnell, wife of the Governor of the colony, who sent plants to Mr. St. Vincent Digby, of Minterne, Dorsetshire, in whose stove it first flowered in July of the following year. Although long called a *Brassavola*, it has little affinity with that genus, and is far more naturally placed in *Lilia*.
- L. × DIGBYANA-MOSSIEI, Veitch = LILIO-CATLEYA × DIGBYANA-MOSSIEI.
- L. × DOMINIANA, Rehb. f. = LILIO-CATLEYA × DOMINIANA.
- L. DOMINIANA, Rehb. f. See LILIO-CATLEYA × DOMINIANA.—I am not at all satisfied about the systematic position of this plant. Accounts of it are certainly contra-

HOME CORRESPONDENCE.

dictory, but from a recent examination of a living plant with a solitary flower, I am inclined to think it is not a natural hybrid at all, but a true species of *Cattleya*, allied to *C. guttata* and *C. porphyroglossa*.

L. × *elegans*, Rehb. f. = *LILIO-CATLEYA* × *ELEGANS*.

L. × *elegans*, vars. *alba*, *Schilleriana*, and *Stenziana* = *LILIO-CATLEYA* × *SCHILLERIANA*.

L. × *enspatha*, Rehb. f. = *LILIO-CATLEYA* × *SCHILLERIANA*.

(10) L. × *EUTRIPHE*, Rolfe, in *Gard. Chron.*, 1888, pt. 2, p. 533. A hybrid raised by Mr. Seden, for Messrs. Veitch, between *L. pumila* Dayana? and *L. crispata* Z. A very handsome little plant.

L. × *exoniensis*, Veitch = *LILIO-CATLEYA* × *EXONIENSIS*.

(11) L. *EVERMANIANA*, Rehb. f. in *Gard. Chron.*, 1888, pt. 2, p. 91; also pp. 74, 109, fig. 12.—Mexico. A supposed natural hybrid, which appeared with Messrs. F. Sander & Co. of St. Albans, and is dedicated to Mr. J. Eyerman, of Easton, U.S.A. Reichenbach speaks of *L. autumnalis* and *L. majalis* as the possible parents, though I cannot see the slightest evidence of the latter, either in the figure cited, or in a specimen sent to Kew by Sir Trevor Lawrence, last October, and which I suppose to be authentic. I should prefer to think of *L. autumnalis* and *L. albidia*, though the original plant flowering in July is somewhat perplexing, unless, indeed, it was flowering somewhat out of course through being newly imported. The petaloid bract which is represented in the figure, and which attracted much attention when the plant was exhibited at the Royal Horticultural Society, has already proved to be an abnormal and inconstant character.

L. × *felix*, Veitch = *LILIO-CATLEYA* × *FELIX*.

(12) L. × *FLAMMEA*, Rehb. f. in *Gard. Chron.*, 1874, pt. 1, p. 599; *Id.*, 1876, pt. 1, p. 394; *Flor. and Pomol.*, 1874, p. 133, with plate; Warr. and Will., *Orch. Alb.*, v. t. 217, *L. Veitchii*, *Fl. and Pomol.*, 1874, p. 116. A hybrid, raised by Mr. Seden, for Messrs. Veitch, between *L. cinnabarina*? and *L. × Pilcheri* Z (the latter a hybrid derived from *L. crispata* Z and *L. Perrinii* Z). The colour is quite unique among Orchids, and the plant one of the most striking hybrids yet raised.

(13) L. *FLAVA*, Lindl., *Bot. Reç.*, xxv. (1839), *Misc.*, p. 88; *Id.*, xxviii., t. 62; Warr. and Will., *Orch. Alb.*, v. t. 226. *Betula flava*, Rehb. f. in *Walp.*, *Ann. Bot.*, vi. (1841), p. 431. *Betula caulescens*, Lindl., *Bot. Reç.*, xxvii. (1841), sub t. 1. *Betula caulescens*, Rehb. f. in *Walp.*, *Ann. Bot.*, vi. (1841), p. 431.—Brazil. Native of the Sierra de Piedade, in the Province of Minas Geraes, also of the Serra do Frio, in the Diamond district, and other localities, always at a considerable elevation. It was introduced in 1839, and flowered in the autumn of the same year in the collection of Sir Charles Linnam, at Carlew, in Cornwall.

L. *furfuracea*, Lindl. = *L. AUTUMNALIS* var. *URUBACEA*.

L. *gigantea*, Warr. = *LILIO-CATLEYA* *ELEGANS* var. *R. A. Rolfei*, *W. Robinson*, *Kew*.

(To be continued.)

TRADE NOTICE.

MR. H. J. JONES, who has for some years past been in partnership with Mr. N. Davies, at Camberwell, has commenced business on his own account at the Ryecroft Nursery, Hither Green, Lewisham.

TRADE PROSECUTION.—We understand that on the result of the late prosecution of a salesman coming to the knowledge of his Grace the Duke of Bedford, he forwarded a cheque for the amount of the solicitor's bill of costs. Whilst we consider this highly satisfactory as relieving the prosecutors from any liability for the cost of the prosecution, we still consider that it would be for the benefit of the trade that the fund we suggested should be raised.

THE WILDSMITH MEMORIAL.—Permit to appeal to all the late Mr. Wildsmith's old friends and visitors to Heckfield, and the usual legion, for a contribution towards the Memorial it is proposed to raise to his memory. Unselfish and singularly free and good natured, taking specially deep interest in the welfare of the Gardeners' Orphan Fund, there is special fitness in the proposal now made to promote a memorial to the deceased gardener in the shape of funds to place a special child on the orphan fund, to be termed the "Wildsmith's Memorial Orphan." To this end, a child in whose future Mr. Wildsmith took deep interest, having prior to his lamented death promised the widowed mother that he would do all in his power to secure the election of the child on the orphan fund, and who is now four years of age, it is hoped that the sum of £130 may be raised, which will amply suffice to place the little one on the fund till 14 years of age. The memorial thus has the merit of being terminable, and who can tell but that ere it expires some other good and honoured gardener may be found whose memory may be worthy of a similar mark of esteem. The list of subscriptions has been well started, and there should be no difficulty in raising the sum needed if all Mr. Wildsmith's old friends will respond. Mr. H. J. Veitch, in London, and Mr. Arthur Sutton, in Reading, receive subscriptions. A. Donn.

SCHOMBURGKIA HUMBOLDTI.—When travelling in Venezuela in the Puerto Cabello and Valencia Railway, I and Mr. Lennis saw some immense masses of *Schomburgkia Humboldtii*. One plant seemed to be at least 7 feet in diameter, and was covered with flower-spikes 6 to 7 feet long. The plants grow in full sunshine, on low trees and rocks, and in a swamp which seemed to be occasionally almost covered by the sea. There are from twenty to seventy flowers on a spike, some being of a light rose colour, others very dark; and, being in such large masses, they can be distinguished at a long distance, and look very fine. The plants are covered with ants, which can hardly be driven off by immersing them in water, their nests being apparently in the old pseudobulbs, which are generally hollow to about one-half. It is a pity the plant cannot be successfully cultivated in this country, but it seems to need the most intense sunshine to grow it well. J. Charlesworth, Heaton.

PLANTING PERENNIALS.—My thanks are due to your correspondent, "J.," for his assistance. I have arranged the border how it should be, but I have not yet planted it, so I should like to know how "J." would propose doing it. The border runs from east to west, and there are six trees planted in the border, two of which are Limes, two Chesnuts, one a Beech, and one a Scots Fir. These are on the north side of it, and under these trees I have planted Portugal Laurels, but the trees overhang most of the borders, which is raised 2 feet 6 inches above the path. The other border I intend to plant in groups of from 3 to 12 feet in diameter, according to size of plants, and I have thoughts of having a dozen of them sown with annuals this season; there will be a space of about 2 feet between each group so as to give easy access when weeding, watering, &c. I shall bear in mind the height to which each group of plants will grow, habit, and the time of flowering, so that there will not be a long gap between any of them; but the border will be gay throughout the season. I do not like the dotting plan at all, it is such a difficult job to find the labels after a frost, and after the borders have been forked over, and the ground gets so hard in front by treading. I feel sure that beds are best, and of which we have a few. We have now four beds of *Hepatica triloba* in full bloom at the present time, which are beautiful, each bed being mixed, single and double forms, and red, white and blue. J. Padlock.

GRAMMATOPHYLLUM SPECIOSUM.—In your last issue I saw an account of the above plant, and it may be of interest to some of your readers to know that the plant flowered in the famed collection at Nonsuch Park, Chesham (Gardener, Mr. Carson), about the year 1837 or 1858, and was supposed to be at the time one of the first plants which had flowered up to that time in England; at least that

was the impression at the time. A. Chitty, s.l. *Wilt-fild Road, Strathana*. [In an account of the flowering of the plant our correspondent mentions, *Gardeners' Chronicle*, Nov. 8, 1859, p. 809, is a remark by the Editor, to the effect that the plant had flowered earlier at Messrs. Loddiges, and was figured in Paxton's *Flower Garden*, Ed.]

SETTING PEACHES AND NECTARINES.—Writers and others have discoursed on the great advantages of having bees in a garden, and endeavour to show how necessary they are for the satisfactory setting of flowers, and some gardeners have even gone the length of introducing a hive into the Peach-house, while others again go to the trouble and spend much valuable time tickling the blooms with rabbits' tails in order to get the flowers to set. Without saying all this is quite unnecessary, for circumstances alter cases, I am clearly of opinion that bees and tails are not wanted for the fertilisation of Peach blossoms, but that a light, moderately dry, buoyant air and suitable temperature, with just a sharp shake of the trees will do more towards getting a good set of fruit, as all the aids above-named are apt to injure the stigmas. The sudden shake sets the pollen flying in clouds, and brings anthers and stigmas in immediate contact. I find I am not alone in these conclusions, as in visiting my friend, Mr. Wallis, just lately at Orwell Park, that he depends on the same method as myself, and his trees bear witness how well it answers, for every bloom seems to have set, and the shoots of both Peaches and Nectarines were simply crowded with fruit, although the house they are in is not well adapted for growing them, it being woody and not sufficiently light. J. Sheppard.

EUCHARIS AMAZONICA.—I read your correspondent's description of this plant and its culture (p. 192), and I certainly agree with "D. F." p. 271, that the plants figured showed very high culture. The collection of *Eucharis* at this place is, I think, worthy of notice, as it consists of thirty plants averaging each a diameter of 5 feet, and a height of 4 feet, all being clean and healthy. As regards watering, I agree with Mr. Bluck that many of the failures noted may be traced to the evils of too much water, too little heat, and too little shade. I find if these plants get copious syringings two or three times daily, they require very little else in the way of moisture, but it is best to examine the pots carefully, at least once weekly, to see that none are getting too wet or the reverse. They delight in plenty of heat, provided a humid atmosphere is maintained, and the foliage is kept well shaded. I do not practise resting the plants, and yet have a supply of flower all the year round by keeping them always growing. I am forced to repot them each third or fourth year, as if left longer than that the roots are apt to burst the pots. As under the compost employed is good loam, some 3-inch bones a little of Thomson's vine manure, and plenty of charcoal broken up, they should not be shifted without disturbing the roots, as by doing so the bulbs soon get crowded into the centre, but the bulbs separated one from the other, and arranged all over the surface of the pot, allowing $\frac{1}{2}$ of an inch between, and just enough soil to cover them. After potting stake up the foliage carefully, and keep it carefully syringed and shaded until established, and they will scarcely lose a leaf. W. L. F., *Kylenore Castle, co. Galway*.

RENOVATING AND MANAGING LAWNS.—A Rifle friend of mine, seeing the labourers at work here top-dressing lawns, remarked that the grass in his garden grows much too strong, and this no doubt is so in some cases; but in the majority of gardens there is a lack of vigour in the grass composing the sward, although not of the weeds amongst them. The most effectual way to deal with weeds is to use diluted vitriol, in the proportion of two-thirds water to one of vitriol, and this may be applied over a large space by a boy in one day. A good deal of care must be exercised by the boy, so that the liquid does not touch his skin or clothes, and an earthen vessel should be used to contain it. The plants may be cut or not, and the grass will occupy the places. The most expeditious way of eradicating moss is to strew fresh-slaked lime over the lawn, giving enough to whiten the surface. Where there is a lack of fine grasses, it is a good plan, when the moss and weeds have been killed and raked off, to sow seeds of an approved mixture of lawn grasses, such as nursery-men prepare for the purpose, and immediately afterwards dress the lawns with fine soil, wood-ashes, and

soot mixed together, to cover the seed and stimulate the growth of the grasses in the old turf. As soon as rain comes the roller may be applied, and afterwards the machine mower, which we know will travel much easier without the moss. To have it always in first-rate condition, the grass should never be allowed to get long, but mown once a week all through the growing season, and using the roller once a fortnight at other times. J. S.

BRUGMANSIA SANGUINEA.—This is a highly ornamental plant for a conservatory where space can be given it, and flowers freely at this time of the year if the house is kept moderately warm. The foliage is ample, and of a deep green colour, and the trumpet-shaped flowers are of an orange-yellow colour. In the conservatory at Rookbury Park, Fareham, there is a specimen of this *Datura* which is fully 24 feet high and 15 feet wide, and the effect produced by the plant covered with flowers as I saw it on February 10 cannot easily be imagined by any one who has not seen a well-grown example. Early in March last year, this plant was pruned to within a few eyes of the old wood; it broke freely, and has grown and flowered ever since almost without intermission. A plant of this size requires a large quantity of water at the roots in summer time, and if it can be provided with a run in the border on which it stands, as has this one, its food supplies are well supplemented in this direction. Vigorous syringing overhead is essential in the summer months, else red-spider would rapidly work harm. S. [If grown in a pot or tub, the plant is best when put out-of-doors in the summer months, choosing a sheltered warm spot for it. Here it will continue to flower, and is easier kept clean than in a house. Ed.]

LILIES IN CASKS.—Mr. Elwes, p. 302, asks how long I have grown Lilies in sunk casks? My first cask was sunk and planted in March, 1880, but I have tried almost the same experiment, as far as the question he raises is concerned, since 1883, having grown choice Lilies in large wooden boxes above-ground in front of shrubs. This having answered well, I adopted sunk casks as being cheaper, and involving less watering. According to our experience, and in our soils, Lilies grow best away from the roots of trees and shrubs, except those of Rhododendrons and other plants which keep their roots near at home than some others, and give protection from early frosts. Mr. Ingram's experiments with old Apple barrels (p. 303) will be very interesting. *George F. Wilson, Heath-chank, Weybridge.*

EARLY RHUBARB.—I shall be happy to show any of your readers my dwarf Rhubarb, wholly unforced, as it is now growing in the open, in my garden; requesting only a letter or post-card making an appointment, any day but Sunday. As the winter was so mild, the Rhubarb this year was somewhat later than usual, St. Valentine's Day. The first good gathering was on Feb. 22. Since then it has been, and is being pulled as required. Should this note fall under the eye of any of the persons to whom last autumn I supplied roots, I should like again to urge them (even if professional gardeners) to please to attend the cultural directions sent; which an experience of several years has proved to be important. *William H. Sewell, Victory Vicarage, Salford.*

FIRE-BLAST.—May not the "disease" mentioned under this name on p. 205 be lightning? Lightning is frequently called "wild-fire," and it is common to hear of trees being "lightning-blasted" and "thunder-blasted." I have heard lightning referred to as "fire" close by here, which is not far from Gaddesden, Herts (not "Goddessden"). I have never seen the true American "Fire-blight" in this country. *W. G. S., Donstable.*

GREEN CROPS AS MANURE. Ordinarily in gardens manuring is done so heavily and continuously, that soil sometimes becomes manure-sick, and crops are either subject to fungus, or decay from sheer plethora of nutrition. Where animal manure is scarce, leaf-soil is dug in so thickly, that the garden ground becomes so light and porous, it is not possible to ensure that firmness essential to the successful production of some crops. Beyond that, the getting into the ground loads of either manure or decayed leaves involves much labour and expense. A capital plan, not only to save labour but also to give the soil a sweet manure, which may prove to be specially acceptable to ordinary garden crops, is to sow on vacant quarters in the autumn, Rye, Tares, white Turnip or Rye seed, thickly, and thus produce

quickly a body of green leafage, which, dug in deeply early in the year, soon decays, and is very rapidly incorporated with the soil. The plan is found to be a good one in stiff soils for late crops, as the green manure proves to be retentive of moisture during hot weather. It is valuable for earlier crops in very light garden soils, and offers a healthy change for the usual dressings of animal manure or leaf-soil. Corn is probably the best for a green crop, because the cereal rapidly utilises from the ground element-ordinary vegetables have left unchanged; and then in the form of green grass and leafage these elements have become readily adapted food for Potatoes, Beans, Peas, and other largely green crops. The more pointing over of vacant soil in the autumn, sowing it thickly with seed to produce the green crop, then digging the same crop in deeply in February or March, is all the labour involved, whilst the product will more than equal a heavy dressing of manure. *J. D.*

CYPERUS ALTERNIFOLIUS.—Every one knows what a very useful thing this is for table decoration and for furnishing vases in rooms, but few perhaps are aware how different plants are that are raised from seed as compared with those obtained in the ordinary way by division or cuttings. The contrast between the two is so great, that on seeing them at Orwell Park the other day, I took the seedlings to be a distinct variety, so slender and refined were they in their several parts, but Mr. Wallis showed them me in different stages, and convinced me that they were both the same, and the seedlings are by far preferable, as they possessed a lightness and elegance not attained by the others. It need hardly be remarked that they were the green form, as the variegated kind does not come from seed, and can only be increased by dividing the plants, and this has to be done with care so as to secure the white portion free from the green. *J. Sheppard.* (*Cyperus distans*, a newer introduction, is superior to the above. Ed.)

SOCIETIES.

ROYAL HORTICULTURAL.

May 11.—The meeting held at the Drill Hall, James Street, Westminster, was a bright and interesting one, and what must have been very gratifying to the friends of the Society, it was very well attended by the public in general, a proof among others that the whereabouts of the Society's meetings are at last become better known. Such flowers of the season as Narcissus, Cinerarias, *Azalea mollis*, were shown in some quantity; Orchids were fairly abundant, some nice specimens of *Dendrobium nobile* and *D. Wardianum* being amongst these, Ferns from Mr. H. B. May were an attraction of some extent. The Director of Kew exhibited some plants which are still rare in gardens, and which ought to be taken in hand by the gardeners more generally, although they would find a difficulty in getting houses full of them, as they now do with *Pelargonium*, *Primulas*, &c.

Mr. H. J. Veitch, at 3 o'clock, began to read his paper on the history of the *Hippeastrum* (*Amaryllis*) as it has been effected by the continuous efforts of his firm through a long term of years. The facts set forth were of much interest, and were well illustrated by flowering bulbs of the various species employed, and some of their progeny, the array being topped by The Champion, one of the finest flowers yet produced by the firm. The lecture was attentively listened to throughout.

A paper by Mr. J. Douglas on the same subject, and which was to have been read, was elected to be printed in the *Journal* of the Society instead. Mr. Douglas being unavoidably absent.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. R. Dean, B. Wynne, W. Holmes, T. Baines, Ch. Jeffries, C. T. Druery, H. B. May, G. Nicholson, H. Herbst, J. Walker, H. Cannell, Ed. Maxley, T. W. Girdlestone, H. H. D'Ombraun, Ch. Noble, J. Fraser, G. Paul, and H. Turner.

The leading exhibit in this section was a group of interesting plants from the Royal Gardens, Kew. The most striking feature was a flowering example of *Godwinia rigas*, with a spathe of deep brown, and over 2 feet in length. *Arisema speciosum* was also shown with some few spathe. The brilliant crimson

and blue of the flowers of *Echmea glomerata* are very attractive. Other plants were *Tacca arctocarpifolia*, with several long leafless flowering scapes, about 6 feet or more in height. The prominent leaves are borne on petioles some 2 feet long, bearing blades of 2 or 3 feet in diameter. *Buphane toxicaria* (the poison bulb), with a large head of flower; *Arisema precox*, *Stroditzia Nicolai*, *Acer oblongum*, showing a fine brown hue on the young leaves. Also *Rhododendrons arboreum*, *roseum*, *nigiligrum*, *grande (argenteum)*, and *formosum*; *Acacias retinodes*, *leprosa*, *vaticillata*, and *pulchella*; *Brownea ariza*, *Ronieletia amena*, and examples of the root stocks of the Arrowroot, *Maranta arundinacea*.

From Mr. H. B. May, Dyson's Lane Nursery, Upper Edmonton, London, was an elegantly arranged bank of decorative Ferns and fine foliage-plants. *Dracaenas* and *Crotoms*, some half-a-dozen different *Aralias*, and such like plants were included with various crested forms of *Pteris serrulata* including *P. s. nobilis*, *Adiantum fairleyense*, *Polyopodium aureum* with an edging of *Isoplepis gracilis*.

Messrs. Barr & Son, 12, King St., Covent Garden, contributed a collection of cut blooms of *Dafodils*, embracing many popular varieties, the most conspicuous being Golden Spur and Horsfield, the whole being relieved by bunches of *Anemone fulgens*, *Scillas*, and *Crocus*.

For the purpose of practically illustrating the remarks made by Mr. H. J. Veitch in his lecture on the *Amaryllis*, there was an extensive collection of bulbs in flower from the Royal Exotic Nursery, Chelsea, in which the progress of the hybridiser was well demonstrated. There was a truly superb flower in The Champion, large, regular, good substance, and of the most bright rich scarlet. The flower measures some ten or eleven inches across. Other notable varieties were *Cicero*, dark red; *Irina*, salmon-red, flaked on white; and *Purepa*, white, with two bands of brick-red on each segment. From the same source came well-flowered *Boronia heterophylla* and *B. megastigma*, with *Azalea mollis* varieties, and finely-grown examples of *Andromeda japonica*: also a pan of the Chinese "Sacred Lily."

Messrs. H. Cannell & Sons, Swanley, Kent, contributed a group of *Cinerarias* in pots—a dwarf compact strain, with well-formed flowers, in a variety of pleasing colours.

Plants of that continental novelty Carnation Madame A. Warocque were contributed by Messrs. J. Laing & Sons, Forest Hill, and were certainly of dwarf habit, but the flowers were not fully developed.

From Messrs. W. Paul & Son, Waltham Cross, came a dozen boxes of cut *Camellia* blooms, in well-known varieties. *Mathotiana* was conspicuous by its size and depth of colouring; also *C. M. Hovey*, *L'Avonir*, *Cap of Beauty*, &c. a very showy exhibit.

A new *Camellia* was sent by Mr. C. Turner, Slough. It is pure white, hardy, and has a full flower, with imbricated and reflexed petals: the name is *La Vestale*.

Mr. J. O'Brien, Harrow-on-the-Hill, sent *Phoenix Roebelenii*. It is a native of Siam, and is a dwarf or pigmy plant growing only 2 feet in height. The plant was about 20 or 20 years. Full particulars will be found in our issues for Oct. 26 and Dec. 28 of 1889, and an illustration is given in the first-named paper. It is an exceedingly elegant Palm, and is certainly decorative.

Mr. F. Gilbert, Dyke Bourne, sent 'Ye Primrose Dame,' primrose deep yellow; and well-grown *Crown imperialis*.

A few plants were sent by Messrs. Paul & Son, Chesham, who had pretty objects in *Polyanthus rose grandiflorus* and double white *Lilac*, *Amaryllis Dark Beauty*, the very dark segments having a prominent green nerve.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair, and Messrs. J. O'Brien, Maxwell T. Masters, F. A. Philbrick, F. G. Tautz, Lewis Castle, H. Williams, E. Hill, J. Douglas, E. Sander, H. M. Pollett, H. Ballantine, and J. Domying.

Messrs. F. Sander & Co., St. Albans, staged a group of well grown specimens, comprising several rare species. The most showy were some large plants of their importation of *Dendrobium nobile*, which exhibited fine quality and great variety. A specimen plant of *Dendrobium Wardianum* was also a striking object, and two plants of *Phaius tuberculatus* with several spikes exemplified the success of Messrs. Sander & Co.

with the culture of this plant as described in the *Gardeners' Chronicle* last issue, p. 299. Messrs. Sander also staged *Dendrobium litaiflorum* superbum; *Maxillaria Hubschii*, like a small *M. grandiflora*; *M. tabularis*, yellow with chocolate crimson markings on lip and petals; *Oncidium heteranthum*, the rare *O. cruciatum*; a new and handsome *Lycaste* with bright yellow flowers, the lip and petals spotted with orange (referred for determination to Kew Herbarium); *Cypripedium Schomburgkianum*, a species near to *C. caricinum*; *Ipsca speciosa* and other species.

Messrs. B. S. Williams & Son, Upper Holloway, had a pretty group, principally of *Odontoglossoms*, well set up with Ferns and palms. There were several good forms of *Odontoglossum crispum* and *O. Pescatorei*; *O. Sanderianum*, *O. Hallii*, *O. lacteum*, *O. Luteo-purpureum*, several fine *O. cirrosum*; a many-spiked plant of the white *O. dendrochilum* glaucum; the curious white-flowered *Epidendrum lanipes*; *Lycaste fulvescens*, with seven of its singular cinnamon-coloured flowers; *Calanthe Regnierii*, and the still handsome *C. Williamsii*, with its rich crimson labellum.

Platina Cooksoni \times a very interesting hybrid between *Phaius tuberculatus* and *P. Wallichii*, raised by Norman C. Cookson, Esq., Wylam-on-Tyne, very caused considerable notice. It is handsome, and in the general appearance of its flowers much resembles *P. tuberculatus*, but the flowers are larger than in that species. The sepals and petals are of a rosy hue tinged with buff; the ample corrugated and crumpled lip, yellow at the base, rose colour in front, marked with crimson of various shades. The plant, which is only three years old, exhibits a much stronger constitution than *P. tuberculatus*.

Another much admired exhibit was *Lycaste Skinneri*, Young's var., sent by Reginald Young, Esq., Fringilla, Linnet Lane, Setton Park, Liverpool. It may be described as similar to the best form of *Lycaste Skinneri alba*, but the labellum and the petals in a less degree are tinged with a lovely hue of pinkish apricot colour. The variety is unique, and there was no two opinions about its beauty.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, exhibited *Cypripedium Numa* \times , a hybrid between *C. Stonei* and *C. Lawrenceanum*. Its flowers vividly call to mind those of *C. Rothschildianum*, but the leaves have narrow green veinings, as in some of the varieties of *C. barbatum*. One effect of the cross is to almost do away with the fold under the pouch as seen in *C. Stonei*.

Messrs. Veitch also exhibited a superb *Dendrobium*, *D. Aspasia* a cross between *D. aureum* and *D. Wardianum*. Its pseudobulbs are stout, like those of *D. Wardianum*; its flowers in form are like *D. Ainsworthii*; the sepals and petals white tipped with pink; the labellum rich yellow at the base, marked with a chocolate-crimson blotch, the front portion white tipped with pink in the same manner as the petals. Also *Dendrobium mitans* \times , and *Cymbidium eburneo-Lovianum* \times , both of which had previously received First-class Certificates, and *Cypripedium Othello* (*C. hirsutissimum* \times *C. Borallii*).

From Messrs. Geo. Paul & Son, The Nurseries, Cheshunt, came a small group of several fine forms of *Cyclopogon cristata*; and from the Duke of Northumberland's Gardens, Sion House, Mr. G. Wythes brought a spray of *Cyclopogon cristata*, Sion var., which the Committee decided was *C. intermedia*, it is near to *C. c. Lemoniana*, but has an orange spot at the base of the lip. Mr. Wythes also brought cut flowers of *Cypripedium villosum*. F. G. Tantz, Esq., Studley House, Goldhawk Road (gr., Mr. Cowley), exhibited the unique *Odontoglossum Pescatorei melanocentrum*. It is a singular and pretty variety with white sepals, petals, and lip, the only colour being a purple blotch on the crest and base of the lip, no yellow being exhibited, as in ordinary forms. Mr. Tantz also sent *Cypripedium selligerrum rubrum \times . G. Appleyard, Esq., Saville House, Saville Road, Halifax, sent a pretty form of *Odontoglossum lebanicum* near to *O. h. lineoligerum*, and which was ticketed *Appleyardianum*—this was too much? H. Marks, Esq., Cheriton, Albourne Road, Beckenham (gr. Mr. W. Cross), sent a well-flowered plant of *Oncidium tetracopis*. J. Larkin, Esq., Derrville, Highbury New Park (gr. Mr. Rinn), exhibited a supposed hybrid *Oncidium* between *O. Marshallianum* and *O. Gardnerianum* under the name *O. Larkianum*! It had flowers much like those of *O. Gardnerianum*, but with lip wholly yellow as seen in *O. varicosum*; the sepals and petals were chestnut brown edged with yellow.*

Messrs. Hugh Low & Co., Clapton, exhibited a natural hybrid *Angraecum* between *A. citratum* and

A. hyaloides, sprays of which were sent for comparison. The new form resembles *A. citratum* in point of beauty, but in the spur following the line of the foot stalk of the flower and in other particulars, it gives evidence of the influence of *A. hyaloides*. The lip is quite ovate.

Messrs. John Laing & Son, The Nurseries, Forest Hill, staged *Cattleya Trianae marginata*, a form with finely expanded crimson lip prettily edged with white.

C. Ingram, Esq., Elstead, Godalming, gr. Mr. Bond, sent a profusely flowered plant of *Cattleya Trianae* "Louis Ingram."

G. Firth, Esq., Manningham Thorp, Bradford (gr. Mr. Collier), staged a richly coloured *Cattleya Trianae* in the way of *C. T. Normani*. A cut spike of *Cattleya Trianae fulgens*, a finely formed variety with glowing crimson labellum.

From the gardens of Sir Trevor Lawrence, Bart., M.P., were exhibited the pretty *Dendrobium signatum*, a species with clear yellow flowers, and the singular *D. Smilliae*.

A cut flower of a striped form of *C. Trianae* also came from Major Mason, the Firs, Warwick, and of three good forms of *Odontoglossum Rossi* majus from Mr. J. W. Wilson, South Cave, East Yorks.

Fruit Committee.

Present.—Sir C. W. Strickland, Bart., in the chair, and Messrs. R. D. Blackmore, H. Weir, T. F. Rivers, G. W. Cummins, W. Bates, G. Cliffe, T. J. Saltmarsh, W. Warren, J. Wright, W. Denning, G. Wythes, J. Hudson, F. Q. Lane, H. Balderson, P. C. M. Veitch, G. Bunyard, J. Willard, J. Cheal, and Dr. Hogg.

Mr. G. W. Cummins, The Grange Gardens, Carshalton, Surrey, sent a collection of Apples and Pears, about 30 dishes of the former. They were well kept samples, including Pine-Apple Russet, *New* Hawthorn, Nelson's Codlin, Lord Derby, and Lawe's Prince Albert; of Pears, *Rede's St. Germain* and *Catillac*. Mr. Miller, gr. to Lord Exley, Ruxley Lodge, Esher, sent a basket of Mushrooms from outdoor beds, fine samples; other exhibits do not call for any mention.

Awards were made as follows:—

BY THE FLORAL COMMITTEE.

First-class Certificates.

To *Phoenix Roebelenii*, from Messrs. F. Sander & Co.; and from Mr. James O'Brien.

To *Amaryllis The Champion*, from Messrs. J. Veitch & Sons.

To *Camellia La Vestale*, from Mr. C. Turner.

Award of Merit.

To strain of *Cinerarias*, from Messrs. Cannell.

BY THE ORCHID COMMITTEE.

First-class Certificates.

To *Phaius Cooksoni* \times , from N. C. Cookson, Esq., To *Lycaste Skinneri* (Young's var.), from R. Young, Esq.

To *Dendrobium signatum*, from Sir T. Lawrence (5 to 4).

To *Dendrobium Aspasia \times , from Messrs. J. Veitch & Sons.*

To *Cypripedium Numa*, from Messrs. J. Veitch & Sons (7 to 3).

Awards of Merit.

To *Oncidium Larkianum \times from J. Larkin, Esq., To *Cattleya Trianae marginata*, from Messrs. J. Laing & Sons (9 to 1).*

To *Odontoglossum Pescatorei melanocentrum*, from F. G. Tantz, Esq.

To *Cattleya Trianae* var. *fulgens*, from H. B. Midway, Esq., To *Cyclopogon cristata* var., from Messrs. Paul & Son.

Botanical Certificates.

To *Cypripedium Schomburgkianum*, from Messrs. T. Sander (3 for).

To *Angraecum \times (new hybrid), from Messrs. H. Low & Co.*

To *Dendrobium Smilliae*, from Sir T. Lawrence, Bart.

Medals.

Silver Banksian, to Messrs. W. Paul & Son, for cut *Camellias*.

Silver Banksian, to Mr. H. B. May, for group of foliage plants and Ferns.

Silver Banksian, to Mr. G. W. Cummins, for collection of Apples and Pears.

Silver Banksian, to Messrs. B. S. Williams & Son, for group of Orchids.

Silver Banksian, to Messrs. F. F. Sander & Co., for group of Orchids.

Bronze Banksian, to Messrs. Barr & Son, for collection of *Dafodils*.

ROYAL AQUARIUM.

March 12 and 13.—This was the first of the series of shows announced by the Company for this year. Exhibits were fairly numerous, the display being made chiefly by the nursery trade. *Dafodils* were the great feature, the collections being very extensive.

The prizes offered for a collection of *Dafodils* (excluding *Tazettas*) brought out a wealth of bloom. Mr. T. S. Ware, Tottenham, Messrs. Barr & Son, Covent Garden, and Messrs. Collins Bros. & Gabriel, 39, Waterloo Road, London, E.C., were respectively 1st, 2nd, and 3rd, each showing comprehensive collections. The best collection of *Cyclamen* (unlimited) was from St. George's Nursery Co., Hanwell, which had small sized plants in a good variety of colours, and well flowered. Mr. J. Odell, Florist, Sec., Gonla's Green, Hillingdon, was a fair second, his plants showing less flower. In the smaller class for 36 plants, the same order of merit obtained.

The leading prizes for bulbous plants were carried off by Messrs. H. Williams & Son, Finchley, London, N., who showed in their usual good style. The *Hyacinths* were very fine, embracing good spikes of *La Grandesse*, *Gigantea*, *King of the Blues*, and *Macaulay*. A collection of *Lily of the Valley* from this firm comprised well-flowered roots, and added one more 1st to Messrs. Williams' list. Mr. R. Dean, Ealing, had a collection of *Primroses* and *Polyanthus* vars., for which he justly received 1st prize. There were in this lot some brilliantly coloured Ferns, such as *Lord Randolph*, a carnine with a tendency to develop a petaloid calyx; Messrs. J. Laing & Sons, Forest Hill, S.E. had the best group of plants.

LAW NOTES.

PLANTS IN UNSALEABLE CONDITION.

M. AUGUST VAN GEERT *v.* MESSRS. J. CARTER & CO.—An action was heard at the Western County Court on Wednesday, which was brought by M. August Van Geert, of Ghent, against Messrs. James Carter & Co., of High Holborn, to recover the price of some *Camellias* supplied in the autumn of last year, and which it was stated reached Messrs. Carter & Co. in an unsaleable condition, the leaves and buds having fallen from the plants; and as M. Van Geert would neither make any allowance nor replace the plants, Messrs. Carter & Co. were compelled to defend the action.

The defence involved the important question as to who was responsible for the damage, as the plants were sent to the Agents of M. Van Geert, in the City, and the defendants had no knowledge of the carriers or the route by which they were sent from Ghent, although they appear to have paid the freight to the carriers in a lump sum with their charge for bringing the plants from M. Van Geert's agents to Messrs. Carter's warehouse in High Holborn, and upon this fact, coupled with the statement in a printed catalogue of M. Van Geert that "all plants travel at the expense and risk of purchasers" it was decided by His Honour Judge Bayley that the defendants were liable.

Obituary.

DR. RALPH AINSWORTH.—The older generation of orchidophiles are one by one disappearing, and we have now to add to those who have joined the majority Dr. Ralph Ainsworth, of L-wes, Broughton, Manchester, who died at his residence, "The Cliff," on Thursday morning, 6th inst., after a very brief illness. He had attained the ripe age of 79, being born in one of the centre streets of Manchester in the year 1811. He was an active supporter of, and sat at the council board of, the Manchester Royal Botanic Society, interesting himself up to the end of his life

in all matters horticultural, being scarcely absent from a council meeting for years. As an orchidist he in time past took a foremost position, being acknowledged in his efforts in that way by Mr. Edward Mitchell, his gardener, who has served under him for a period of thirty years. We well recollect the marvellous specimen of *Aerides Schroderi* which was tabled year after year, the many excellent specimen orchids in grand style with superb leaves and equally superb branching racemes of flowers. Indeed the most difficult one of all to grow. *P. Grandiflora* was for many years remarkable in what was called "The Doctor's" collection, and so were *Saccolabium's* and a great many of those distichochous leaved orchids that are found so difficult to cultivate, at least to go on cultivating with success year upon year. Some 15 or 18 years ago we well remember the excitement over the splendid specimens of *Dendrobium Ainsworthi* × *Ainsworthianum*, an exhibition which did great credit to Mr. Mitchell as a hybridist as well as a cultivator in those days when most of the hybrids had their origin in the Veitchian establishment. The strength of the doctor's collections as markedly in East Indian orchids, and when the immense quantities of *Odontogloss* and *Masdevallias* from cooler regions were introduced, and plants used to be hedged out to make a formidable show, the doctor comparatively retired.

THOMAS HARRISON, SENR.—It is with regret that we record the death of Mr. Thomas Harrison, in his seventy-fifth year, and who until within the last few years was senior partner in the well-known firm of Harrison & Sons, seed growers and merchants, Leicester. The deceased gentleman had for some time past suffered from delicate lungs, but considering his age he enjoyed tolerably good health throughout the whole winter up to the last few days, when he caught a chill; congestion of the lungs and bronchitis ensued, and he succumbed on Tuesday evening, March 4.

THE PAST WEEK.

The following summary record of the weather for the week ending March 8th, is furnished from the Meteorological Office:—

"The weather during this week has been characterised by great and sudden changes. At times the conditions have been very fair and extremely cold; at other times snow or rain has been general, and at the air mild. At some of the Scotch stations the snow-fall has been heavy. Thunder and lightning occurred over the north of England and in some parts of Ireland on the 8th.

"The temperature has been subject to very frequent changes, but has been, on the whole, below the mean in nearly all districts. Soon after the commencement of the week it became exceedingly low for the time of year over England, and during the night of the 3rd—4th, the thermometer sank to the abnormally low value of 6° at Hillington, 11° at Rothamsted, and to between 13° and 17° at many of our other southern and south-eastern stations. The newspapers report that much lower values were registered in some parts of Kent and Surrey. In Scotland the absolute minima varied from 10° at Braemar to 18° at Glenelg, and in Ireland from 17° to 22°. Even at Jersey the minimum was as low as 21°. During the latter half of the week the thermometer over England and Ireland was much higher and minima were recorded ranging from 52° in 'England, N.W.' to 57° in 'Ireland, N.' and 'England, S.' and 58° in 'England, E.'

"The rainfall has been more than the mean over the greater part of Scotland, and has just equalled it in 'Scotland, W.' in all other districts, however, a deficit is shown.

"Bright sunshine does not differ materially from that recorded last week, the percentage of the possible amount having ranged from 16 in 'Scotland, N.' to 31 in the 'Midland Counties,' 33 in 'Ireland, S.' 40 in the 'Channel Islands,' and 43 in 'England S.W.'"

MARKETS.

COVENT GARDEN, March 13.

Our market is now supplied with a few samples of late Grapes, and a fair quantity of early forced vegetables, with prices generally lower. Imported goods include new Potatoes and Tomatoes. *James Webber, Wholesale Apple Market.*

POTATOES.—Old Potatoes continue to fall in value. For ordinary and inferior grades prices rule, 30s. to 50s.; best samples, 60s. to 80s. per ton. The supply of Canary New Potatoes is not so heavy—prices firm and the same as last quoted. *J. B. Thomas.*

ENQUIRIES.

"Has that questioner's much shall learn much."—BACON.

ANDROMEDA JAPONICA.—A correspondent asks the probable reason why this plant does not flower with him. It is planted in heat, and is in good health.

NOTICES TO CORRESPONDENTS.

BLOOD MANURE: J. K. Powdered clay would absorb the blood, and be afterwards dried artificially. Probably it would, when dry, absorb once again.

BOOKS: Unlucky Fungologist. Cooke's *Illustrations of Fungi*, parts I to 59, form 6 vols., with titles and indices; parts 62 to 72 constitute Vol. VII., for which title and index are given in part 73. Then Vol. VIII., or supplement, will contain parts 41, 69, 61, 73 to 75, with index and titles, completing the work.—*J. C. & Co.* The best we know in English is Wm. Paul's *The Rose Garden*, 5th Ed., Kent & Co., 23, Paternoster Row. There are coloured illustrations of fine varieties of the Rose.

BUSINESS CONDITIONS: J. L. Messrs. Sutton have the full right to impose what conditions they please especially as they make no secret of the matter.

FERNS IN BUSHEY PARK: A. B. *Pteris aquilina*—common bracken.

FUNGUS ON ROOTS OF FRUIT TREES: Enquirer. Yes—tree-roots are often attacked by fungi which may or may not be bred on decaying wood and other vegetable matters in the soil. Do not plant a fresh tree before searching for the roots of the old one if it will replace. It is not certain that these will form breeding places for fungi injurious to the fruit tree, but they might; indeed if all decaying vegetation of the nature of tree-roots did so no plant would be safe for any length of time. A half wet state of the soil of the fruit border is a prolific cause of fungus growth, both above and below; whereas thorough saturation in autumn, winter, and spring, is good for the trees and tends greatly to the retention of the fruit buds, as well as drowning out fungus. Whenever it can be done, the new fruit tree stations should be trenched early in the autumn, not planting the trees till February.

GRAFTING WAX: A. S. D., and others. Beeswax, 8 ozs.; mutton suet, 10 ozs.; powdered resin, 1 oz. Make warm, and mix well together. If it be sticky add a little more suet. This kind of grafting wax must be kept warm when being used, in a glue-pot with hot water, or better still, with a small lamp beneath it like a food warmer. Mastic, "Homme Lefort," is sold ready for use by florists and nurserymen. Either is good for Roses, stove and greenhouse plants; but fruit trees have the grafts more economically covered with the ordinary clay and chaff mixture.

HEDGE IN SHADE OF TREES: A. C. *Thuja occidentalis*, *T. sibirica* (plicata), and common Yew. If the shade is not very dense, *Symphoricarpos racemosus* (Snowberry), Yellow-flowered Ribes and Holly. Cornus makes a capital hedge in shady places, and bears cutting well for a great many years.

KAINIT FOR POTATOES: C. M. P. At the rate of 3 cwt. to 5 cwt. per acre.

LONDON PARKS: A. B. There is much information on the parks around London scattered through our volumes since the commencement of the

THE WEATHER.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 4° Fahr. for the period named; and this combined result is explained in Day-degrees—i.e., "Day-degrees" = wind-fying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.	BRIGHT SUN.
	Above 4° or below (-) the Mean for the week ending March 8.	Above 4° for the Week.	Below 4° for the Week.	ACCUMULATED		
	Day-deg.	Day-deg.	Day-deg.	Day-deg.	10ths Inch.	In.
1	3	43	+ 1	42	7	17
2	1	7	43	- 3	28	27
3	2	7	35	- 11	45	22
4	5	4	48	- 31	11	1
5	4	8	41	- 23	15	3
6	5	6	43	- 6	10	1
7	1	8	28	+ 5	36	0.4v.
8	3	4	30	- 5	25	1
9	5	8	33	- 14	4	4

11	2	15	23	- 13	12	4
12	3	13	24	+ 49	2	1

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing Counties, Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

Gardeners' Chronicle, but we have no time to look up such matters. Consult the file at the British Museum. We could supply numbers not older than ten years.

MAOGOT IN CHEYSANTHEMUM LEAVES, AND ALSO ON CELERY: S. C. A leaf-miner, Tephritis onopordii. There is no means known of catching the fly which lays the eggs in the substance of the leaf, but the pupa which descend into the earth, may be destroyed by turning it up in frosty weather. All leaves affected with the maggot ought to be gathered as soon as observed, and burnt.

NAMES OF PLANTS: C. Thompson, 1, Primula erosa, P. denticulata var. erosa—a Himalayan Primrose resembling a depauperated form of P. denticulata; 2, P. verticillata, the Abyssinian Primrose—a common greenhouse plant, and not hardy. Neither resembles P. amurea, which has flowers as large as an English Oxlip. C. W. Dod.—R. W. H., 1, Aspidium dilatatum; 3, Ceterach officinarum; 5, Blechnum, or Lomaria spicatum; and 4, labels detached—one is Polypodium vulgare. Please send other specimens.—A. H., Dendrobium undulatum.—H. Bazeley, 1, Begonia Prince Wallenstein; 2, B. heterocotylefolia; 3, B. subpeltata var.; 4, B. metallica; 5, B. fuchsioides; 6, Aspidium vulgare var. proflera.—L. C., Ruyby, Merely a bright form of Cattleya Trianae.—C. de B., Abutilon insignis.—A. H., "We cannot name garden varieties."

NURSERY RATING: A. F. See Gardeners' Chronicle for March 8, 1889, p. 308. "Nursery and Seed Trade Report," the latest edition on the above matter.

PANSY BURNT BROWN COLOUR: Chiswick. It may be obtained of florists dealing in pansies.

PEARS ON EAST WALL: A. F. Napoleon, Brown Beurré, Winter Nelis, Marie Louise d'Ucle, Fondante d'Automne, Jersey Gratiot, Eyewood, Beurré d'Aremberg, Vicar of Winkfield, Thompson's, Sommer France Real, and Jean de Witte.

RICHTER'S IMPERATOR POTATO: A. P. It may be obtained through Messrs. Vilmorin Andrieux & Co., whose agency is in Mark Lane, E.C.

SCOTCH FIR: F. H. The leaves are affected with a fungus, Peridermium pini. Remedial measures are not likely to be of any use, but affected trees should, if possible, be burnt, and all the ground in the neighbourhood destroyed as far as possible. See Marshall Ward's Timber and its Diseases (Macmillan), p. 257.

SHRUBS TO BLOOM IN WINTER: A. C. Daphne mezereum, Lonicera Standishi, Forsythia suspensa, F. Fortunei, F. viridissima, Jasminum nudiflorum, Rhododendron dahuricum, Erica carnea, E. herbacea. The last three are peat plants. Arbutus unedo often retains its bloom till the winter.

SLUFS IN ORCHID HOUSE: H. A. Pieces of Carrot laid about on stages and floor entice them; tiles and slates, raised about half an inch from the floor, these forming favourite hiding-places for the creatures, and should be examined daily. Toads are of much use in a glasshouse. Plants much liable to be injured by slugs may be elevated over pans of water, or finely broken glass may be placed in a ring round them.

BROWN and BLACK FIBROUS PEAT, 25s. per Ton, or 45s. per Truck of 4 tons; Bags, 5s. each; 10 Bags, 45s. PEAT for farms, Rhododendrons, Begonias, &c. American Plant Beds, 21s. per Ton, or 45s. per Truck of 4 tons. THOMAS WALKER, Tokels, Camberley, Surrey.

TO MARKET GARDENERS, &c.—To Grow Fine VEGETABLES and FLOWERS, Gardeners should use SULPHATE of AMMONIA. One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary Stable or Farm-yard Manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price on rail, at Sixpence per 100 lbs., or 7s. per 56 lb. P.O. Orders payable to the Manager, Shellfish Gas Company, Sheffield.

SAVE HALF THE COST. GARSIDE'S BEDFORDSHIRE SILVER SAND

Is admitted by the leading Nurserymen to be the Best Quality obtainable in the Trade. Consumers should Buy Direct from the Owner of these Celebrated and Extensive Pits, which contain a practically inexhaustible supply of Splendid Sand, and thus save half the ordinary cost. NO TRAVELLERS OR AGENTS. Apply direct to the Proprietor for Samples and Price free on Rail or Canal. All Orders executed with the utmost promptness and under personal supervision. Special Railway Rates in force to all parts. All kinds of PEAT supplied at lowest possible prices. Sample Bag sent on application to GEO. GARSIDE, Jun., F.R.H.S., Leighton Buzzard, Beds.

COLE'S BLOOD AND BONE MANURES.

Manufactured from Animal Substances. Rich in Ammonia. Readily absorbed by the Plant. Suitable for all soils, and for all varieties of crops. Detailed Price List and Testimonials on application. J. H. COLE, Calne, Wilts.

WORM DESTROYER, for eradicating every kind of Worm from the roots of large Specimen Plants, Fats, Lawns, &c. It is easily and cheaply applied, and will not harm the most delicate plant. In bottles, 1s., 2s. 6d., 7s., and 12s. 6d. each.

FOWLER'S GARDENERS' INSECTICIDE for destroying and preventing Insects, Blight, and Milder infesting Plants and Trees. It is easily applied, either by Dipping, Spraying, Spousing, or as a Winter Dressing. Does not require cleansing off with water; will not stain or injure any more than plain water; and gives the foliage a bright, clean, and healthy appearance. In Jars, 1s., 6d., 3s., 5s., 6d., and 10s.; and in Kegs, 28 lb., 21s., 56 lb., 42s., 112 lb., 84s. each.

FOWLER'S MEALY-BUG DESTROYER, for the Special Eradication of this most troublesome of Store-house Plant Pests. It is easily applied, either with a small brush or vapourer; is instant destruction to both insects and ova, and does not stain or injure the foliage. In Bottles, 1s., 2s., 6d., 5s., and 10s.; Half-gallon, 21s.; One Gallon, 42s. each.

"PICRENA," THE UNIVERSAL INSECTICIDE.
SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of one to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, kills the late of Scale of all sorts in a few seconds; while 3 oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies are applied through common syringe or garden engine, a much severer test of efficiency than when applied by hand-washing or spray.—I remain, dear sirs, yours truly, (Signed) A. MACKENZIE, of Messrs. Methuen & Co., Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENEUMEN I have given your Insecticide, "Picrena," a good trial in competition with many others. I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insect pests than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 4s. 6d., in Tins 1 and 2 gallons, 10s. 6d. and 20s. each, in quantities of 5 gallons and upwards, 9s. per gallon.
Prepared only by
DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.
May be had from R. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from

ANTHRACITE COAL

The Best and Cheapest Fuel for Greenhouse Boilers, Stoves, and Heating Apparatus.

HENDREY & CO. ANTHRACITE SMOKELESS COAL—The UNITED ANTHRACITE COLLIERIES (Limited) supply their Nut or Cobble Coal (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered in truckloads to any railway station. This coal is ABSOLUTELY SMOKELESS, and it requires much less attention than any other description of fuel, burning for twelve hours at LEAST without any supervision, and giving from five to ten degrees more heat than coke. Quotations can be had on application to the Company's Offices, 25, Lane Street, London, E.C.

Quotations for London delivery can be obtained for the Northern, Western, and South-Western districts, from Messrs. H. R. CARTER and SON, Coal Exchange, E.C.; and for the South-Eastern district, from Messrs. W. DOWELL and CO., Coal Merchants, Greenwich, S.E.

To Nurserymen, Seed Merchants, and Florists.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DICKY LANE, to W. RICHARDS, as, unless the usual of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

W.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Gardeners, Farm-Balliffs, Foresters, &c. DICKSONS, Royal Nurseries, Chester, (Limited), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, Chester."

HEAD GARDENERS.—At the present time I can recommend several highly respectable MEN, of known ability and first-class character.—THOS. BUTCHER, Seed Merchant, Crofton.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Foresters, and Farm Balliffs. LITTLE AND BALLANTYNE, The Queen's Nurserymen and Seedsmen, Carlisle, invite correspondence with Landed Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, and FARM BALLIFFS. Their extensive business relations throughout the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

TO FLORESTS.—A young Lady, age 24, seeks situation. Good references, and experienced in all its branches.—E. T., 629, High Road, Chiswick, London.

HOLLOWAY'S PILLS.—Indigestion and Liver Complaints.—The digestion cannot be long or seriously disordered without the derangement being perceptible to the countenance. These Pills prevent both unpleasant consequences; they improve the Appetite, and with the increase of course for food they augment the powers of digestion and assimilation in the stomach. Holloway's Pills decide most satisfactorily with deranged or disordered conditions of the many organs engaged in extracting nourishment for our bodies from our various diets—as the liver, stomach, and bowels, over all of which they exercise the most salutary control. By resorting at an early age to this mildly to these purifying and laxative Pills, the dyspeptic is speedily restored to health and strength, and his sallowness gradually vanishes.

SANKEY'S GARDEN POTS

Are used by the leading Horticulturists and largest Nurseries in the World, and acknowledged by all to be the lightest, strongest, best coloured, most perfect shaped and finished pots ever manufactured.

MARKET POTS,

Or Long Tons, are largely used by Market Growers—they are made a greater depth, wider at bottom, and save half an inch in width at top over ordinary pots. Have no rims.

VINE POTS

Are used by the leading Vine Growers throughout the kingdom, and pronounced unequalled for Vine Culture.

CHRYSANTHEMUM POTS.

Considerably deeper than ordinary—very broad at bottom, almost upright in shape; do not blow over when outside, like narrow-bottomed pots; give maximum amount of room for nutriment at roots of plants.

CLEMATIS POTS.

OPINION.—“Your pots are light and strong, first-class colour, shape, and finish. The ‘Clematis’ Pots gave unqualified satisfaction to ourselves and customers.”—Messrs. Wood & Ingram, Huntingdon.

ROSE POTS.

OPINION.—“We beg to say that we are highly satisfied with your Garden Pots; they are well made, light, yet strong, and we like them better than any others we have ever used.”—Messrs. Richard Smith & Co., Nurseries, Worcester.

“The Flower Pots you have largely supplied us with are light, strong, and well made, and in every respect highly satisfactory.”—Messrs. Dicksons Ltd., Chester.

“For nearly thirty years I have been using your Garden Pots, and still find them the best and cheapest.”—Mr. William Bull, Chelsea.

“We have always found your Pots highly satisfactory. Great improvements last few years in them.”—Messrs. Pearson & Sons, Chilwell Nurseries, Notts.

Morton's Nurseries, Mowden, Darlington. To NURSEMEN, SEEDSMEN, FLORISTS, and OTHERS interested in the Horticultural Trade.

MESSRS. THOMAS WATSON AND SON, Auctioneers, will SELL by AUCTION, at the Darlington Auction Room, Northumberland Street, Darlington, on TUESDAY, March 25, 1890, at half-past 7 o'clock in the evening precisely, subject to such Conditions as will be then read, that VALUABLE OLD ESTABLISHED NURSERY, about Two Acres in extent, known as and being the Mowden Nurseries, in the occupation of Mr. T. B. Morton, the world-famed Chrysanthemum grower, and situate about 1/2 miles from the Market of Darlington, (consisting, with the MESSRS. WATSON'S DWELLING-HOUSE, STABLE, CARRIAGE BUILDINGS, and GLASS-HOUSE erected thereon, viz.—Iron framed Chrysanthemum-house, 47 feet by 22, and 14 feet high; Iron framed House, 52 feet by 12, with Pergola, and 12 feet square at end, and 40 feet of heated frames at side; Wood framed House, 52 feet by 12, in three divisions; Wood framed House, 30 feet by 15; Wood framed House, 40 feet by 14; Iron framed House, 40 feet by 12; and Wood framed House, 21 feet by 12. Six of the Houses are built on brick and concrete bases, and are of modern and unique construction, and glazed with large squares.

The Nurseries are watered by two powerful boilers, and about 1,000 feet of 3 and 4 inch piping. The Nursery is well stocked with fruit trees, and is situate in close proximity to the Cocker Beck, from which a constant supply of water is obtained by means of an American pump, connected with which a sack tank estimated to hold 500 gallons. The Messuage or Dwelling-house contains on the ground floor two sitting-rooms, Kitchen, and Small Room (the latter used as an office); and on the 1st floor five good bedrooms, approached by front and back staircases.

Adjusting an excellent 3-stalled Stable and Orchard, with large Loft over. The property may be viewed, and further information and particulars may be obtained, on application to the Auctioneers, Mr. T. B. MORTON, Mr. J. T. HALL, 11, High Row, Darlington; Mr. G. S. SELLOR, Homedgate, Darlington; or, WILKES AND WILKES, Solicitors, Middleburn, Darlington.

JOHN SHARPE & SON'S AMATEUR'S GARDEN GUIDE contains Sterling Novelties, with full reports from the best known authorities.

CANNELL'S BEGONIAS.

Tested by two of the most successful amateur growers in America, side by side with all the European strains, the following are their exact words, which certainly proves that ours are the finest in the world.

Mr. H. McCrowe, *Gardener to E. S. Michener, E. J. Woodcock, & Co. America, February 28, 1890.*
"I assure you the Begonias I got last year from your firm created quite a sensation over here, leaving all others far behind."

Mr. W. E. Endicott, *Clinton, Mass., U.S. America, February, 1890.*
"Dear Sir,—I had 100 of your ordinary seedling Begonias last year, and they were very much finer than the German, French, Italian, and Belgian varieties, some of them high priced, and grown in the same house. What, then, must your extra quality seedlings be?"

Seeds, best Single, mixed, 2s. 6d. packet; Double, 6s.

Come and see our many Thousands of Seedlings. Send for our ILLUSTRATED DESCRIPTIVE LIST, the best and most complete yet issued.

Carriage paid to the Principal Railway Stations in the United Kingdom.

SPECIAL.—A FEW TESTIMONIALS OUT OF THOUSANDS RECEIVED.

Bathursten, Ashford, Kent, June 14, 1878.
Gentlemen,—Your "Silens Messor" Mower, 20-inch, works splendidly. It is a most perfect machine, and beats the old 20-inch one that for so many years did my work without repairs. I recommend your machines, and never see any doing such good work and with so little power. You may refer anyone to me, and I will then show them the S. M. at work, and I shall show it to all I can.
I am, yours truly,
W. H. MOLD.
Messrs. Green & Son.

Kinbury, Hungerford, April 20, 1883.
Sir,—I shall be glad of a list of your Lawn Mowing Machines, please. I am glad to mention that I bought one of your 14-inch machines 22 years ago. It has had hard and rough usage every year since, and only on Monday was it put quite out of use by the snapping in two of the driving wheel under the hammer. It is surprising to think of the work it has done, and done well.
Yours faithfully,
ALFRED T. BAZETT.

Ivy Bank, Broadway, Worcester, April 13, 1884.
Gentlemen,—Some fifteen or sixteen years ago, I had from you one of your 12-inch Lawn Mowers which, I may say, has from that day to the present time given perfect satisfaction, and goes as easily, and does its work as well now as it did at first. I have recommended yours as the best machine ever since.
I am, yours faithfully,
Messrs. Green & Son, Leeds. C. FRENCH HARTLEY.

Royal Gardens, Windsor, January 25, 1890.
To Messrs. Green & Son, Limited.

Dear Sirs,—In sending you the enclosed order for Lawn Mowers, I think it may be interesting to you to know that I am still using the Horse Machine you supplied in the year 1856; it is in perfect order even now, which is a proof that the workmanship is first-class, and speaks for itself.

As to your "Hand Silens Messor," no Lawn Mowers could give greater satisfaction either to myself or to the men who work them, they are unequalled.

During the season I have them in daily use in the Royal Gardens here, and never have the slightest trouble with them.

Your machines are also the only ones I have in use at the Private Gardens, Hampton Court Palace; the Royal Lodge, Windsor Great Park; Cumberland Lodge, and the Royal Pavilion Grounds, Alton-shot.

I shall feel a great pleasure in recommending them to all my friends.
I remain, dear Sirs,
Yours very truly,
THOMAS JONES.

Wellingborough, February 4, 1890.

To Messrs. Green & Son, Leeds.
Gentlemen,—I have sent you our Lawn Mower for repairs, which please have done to it. I have used your machines for

25 years, and I find them more durable and do their work better than any other machines I have seen.

I am, gentlemen, yours truly,
DAVID FERCVIAL,
(Gardener to W. Blott, Esq.).

Cottingham, Hull, February 13, 1890.

To Messrs. Green & Son, Limited, Leeds.
I am instructed by Arthur Harrison, Esq., of Northgate House, Cottingham, near Hull, who has had one of your 36-inch Horse Mowers in use over 20 years, and ask whether you think it advisable to send it for repair or have a new one, for it is as you may suppose now getting worse for wear. Kindly say per return, and enclose Price List.

I am, gentlemen, yours truly,
JOHN BAYNTON.

Mr. J. R. STIRLING, of the Royal Gardens, Buckingham Palace, writing under date February 24, 1890, says—

.. As regards the work your 42-inch Horse Machine does (which two years ago took the place of the one you supplied in '63), I may say it is kept in constant use here from February until the end of the mowing season, and continues to give the greatest satisfaction. It is the best Machine I know for good work and durability, and your "Hand Silens Messors" also excel all others. We have no other Lawn Mowers in use here, and I always recommend them to all my friends who inquire about Lawn Mowers.

OVER 155,000 SOLD.

THEY CAN BE HAD OF ALL RESPECTABLE IRONMONGERS AND SEEDSMEN IN THE UNITED KINGDOM,
OR DIRECT FROM THE MANUFACTURERS—

THOMAS GREEN & SON, LIMITED,

SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON, S.E.

DANIELS BROS.,

TOWN CLOSE NURSERIES, NORWICH,

BEG to offer the following from their splendid Collection of Choice Named FLORISTS' FLOWERS, &c., all guaranteed true to name, and sent Carriage Free at prices quoted:—

- Chrysanthemums.—Strong rooted cuttings from our fine collection of Japanese and Incurved varieties ... per 100, 15s. 2 6
Extra choice sorts ... per 100, 21s. 3 4
Six superb new Japanese, including Mr. Alpheus Hardy, 7s. 6d.
Fuchsias.—Single and Double-flowered. All the most beautiful sorts. Nice young plants from single pots ... 6 for 2s. 6d. 2 6
Extra choice and new varieties ... 8 for 3s. 6d. 6 0
Four superb new varieties, including Countess of Aberdeen, 5s. 6d.
Pelargoniums.—All autumn-track, well-rooted young plants from single pots ... 6 for 2s. 6d. 2 6
Single flowered Zonal, from our magnificent collection, including the newest and most beautiful sorts ... 8 for 2s. 6d. 4 6
Extra choice and new varieties ... 8 for 3s. 6d. 6 0
Six superb new varieties of 1889 (Pearson's set), 7s. 6d.
Double-flowered Zonal. A splendid class of highly improved varieties. Fine named sorts, our selection ... 6 for 2s. 6d. 4 6
Extra choice varieties ... 6 for 3s. 6d. 6 0
Six superb new varieties of 1889, 7s. 6d.
Double-flowered Ivy-leaved. A magnificent class. Splendid for pots, hanging baskets, vases, or for bedding out. Fine varieties to name ... 6 for 2s. 6d. 4 6
Extra choice sorts ... 6 for 3s. 6d. 6 0
Three fine new varieties of 1889, 4s.

- Carnations and Picotees.—Choice named varieties, our selection ... 6s., 9s., and 12 0
Hardy Flowering Plants.—A splendid assortment, including such fine plants as Helianthus pumilus, Anthemis pallida, Perennial Phloxes, Lychnis splendens, &c. Established plants from single pots ... per 100, 20s.; 25 for 8 4 6

- Begonias, Tuberosus-rooted, Single.—Immense flowers, and in the most beautiful variety. Strong flowering dormant tubers ... per 100, 10s. 6 0
Double-flowered, splendid varieties ... 9 0
Gladolus, Gandavensis hybrids.—Choice named sorts, our selection, in splendid variety of showy sorts ... 4s. 6d. and 6 0
Exhibition varieties, very fine ... 9s. and 12 0
Irenelypens, the fine old showy scarlet variety ... per 100, 10s. 6d. 4 6

DANIELS BROS.,

TOWN CLOSE NURSERIES, NORWICH.

HARDY CLIMBERS, to Cover Trellises, Walls, Rockeries, &c. 12 finest Climbers, 10s. 6d.; 12 variegated, and other Hardy Trees, 2s.; Ampelopsis, of sorts, Jasmines, Honeysuckles, 9s., 1s., and 1s. 6d. each; Climbing Roses, 6s. per dozen. Now LIST, 160 pages, 7s. stamp. CLIFTON, Oldfield Nursery, Atrincham and Manchester.

FARM ROOT SEEDS.

CHARLES SHARPE & CO.

WILL SEND SPECIAL QUOTATIONS OF THEIR HOME-GROWN FARM SEEDS ON APPLICATION.

SAMUEL SHEPPERSON,

Florist and Seedsman, PROSPECT HOUSE, BELPER, DERBYSHIRE,

Desires to inform the readers of this Paper that he is prepared to execute Orders for the following Plants, all of which are of the very finest strains that money can buy. They have all been grown on the Derbyshire hills, and are hardy and strong. Carriage free. Cash with order. Descriptive LIST, 3d., free to customers.

CHRYSANTHEMUMS.—Special culture, not a collection of old-fashioned sorts, but the cream only of the best English, French, American, and Japanese raisers, including the very latest novelties. Good well-rooted plants, 12 for 1s. 6d., 25 for 2s. 6d., 100 for 7s. 6d., true to name; 12 varieties, all new of 1888 and 1889, for 4s.

PANSIES.—A great Speciality. Five Silver Cups, and other Prizes. The cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, 12 for 1s., 25 for 2s. 6d., 100 for 7s. 6d., true to name. Also Seed, 1s. and 2s. 6d. per pkt.

PHLOX, special culture, the cream only from Downing, Laird & Sons, Kilsay, Wars, and other first-class growers. Six fine varieties for 2s., 12 for 3s., true to name. Strong stools, to bloom well.

CARNATIONS, PICOTEES, and CLOVES.—Strong layers, to bloom well, finest named varieties, 12 distinct colours for 4s., 25 for 7s. 6d. Also Seed, 1s. and 2s. 6d. per packet.

CANTERBURY BELLS.—Grand new colours and new forms, double and single, telescopes, cup and saucer, and other varieties, 12 plants to bloom well, 1s. 6d.; 25, 2s. 6d. Also Seed, 6d. and 1s. per packet.

THE BEAUTIFUL PURE WHITE and PINK MALVA MOSCHATA, one of the best hardy border plants in cultivation. Strong 2-year old plants, 12 for 1s. 6d.; 25 for 2s. 6d.; also seed, 6d. and 1s. per packet.

HOLLYHOCKS.—Warranted all fine double flowers. Choice selection of sorts. Strong year-old plants to bloom well, 12 varieties, 2s.; 25 varieties, 2s.

POLYANTHUS and PRIMROSE.—Hybrids, splendid mixed colours, finest strain grown, 12 for 1s. 6d.; 25 for 2s. 6d.; 100, 9s., all good blooming plants. Also Seed, 6d. and 1s. per packet.

HYACINTHUS CANDIDANS.—A really fine and steadily hardy well flowered border plant. Six flowering bulbs for 1s. 6d., 12 for 2s. 6d.

DELPHINIUMS.—In all the colours found in this deservedly popular class of border plants. Strong plants to bloom well, 12 for 1s. 6d., 25 for 2s. 6d., 100 for 7s. 6d., true to name. Also Seed, 6d. and 1s. per packet.

FOXGLOVES.—Gloxinia flowered. Bean's grand new large spotted, and pure white varieties, 12 for 1s. 6d.; 25, 2s. 6d. Also Seed, 6d. and 1s. per packet.

SWEETLY-SCENTED PURE SNOW-WHITE PINKS, quite hardy, 12 for 1s. 6d., 24 for 2s. 6d.

CARNATIONS, PICOTEES, and CLOVES.—Strong year-old plants, from the best varieties only, including many new sorts; 12 best full varieties for 2s. 6d., 6 for 1s. 6d., 100, 7s.

FANCY PANSIES.—Unnamed, 12 for 1s. 6d.; 25 for 2s. 6d.; 100 for 7s. 6d. All different and first-class sorts.

THE NEW DOUBLE SCARLET GEUM.—A hardy free bloomer, about 18 inches high, 12 for 1s. 6d., 25 for 2s. 6d., 100 for 7s. 6d., true to name. Also Seed, 6d. and 1s. per packet.

AURICULA (Alpinus). A splendid collection. Strong plants to bloom well, most beautiful colours and sweetly scented, 12 for 1s. 6d., 25 for 2s. 6d., 100 for 7s. 6d., true to name. Also Seed, 6d. and 1s. per packet.

THREE WHITE GEMS, CAMPANULA PERSICIFOLIA, Single White, Double White, and CORONATA, all quite hardy and unrivalled for cut flowers, 3 of each for 2s.

THREE WHITE HARDY BEAUTIES GADALIALUM LANATI M. everlasting, last for years after being cut. IBERIS CORNIFOLIA, evergreen, and purple white flowers. ARGENTEA ALBA, the largest pure white, 1 each for 1s. 6d., 2 each for 2s. 6d.

TOMATOES.—The best sorts in cultivation.—See Chiswick Great Tomato Trial. 1s. 6d. per dozen.

TWO GEMS, PRIMULA CORTUSOIDES and PRIMULA CASHMIRIANA.—Gardening papers say it would be difficult to find more beautiful plants for the Rockery, Borders, or Greenhouses than these, 2 each, 1s. 6d.; 4 each, 2s. 6d. Also PRIMA S. Subulbifera, the Queen of Primulas, Giegie's International Prize, 3 distinct varieties named for 2s.

12 HARDY PERENNIAL BORDER PLANTS (named), distinct and useful for decoration and cutting purposes, for 2s.

12 VARIETIES OF SHOWY, Free-flowering, and other WINDOW PLANTS (named), for 2s.

NEW STRAWBERRY, NOBLE (Laxton's).—This is, without doubt, the earliest, handsomest, largest, and best Strawberry in cultivation; 12 fruiting plants for 1s. 6d., 25 for 2s. 6d., 100 for 7s. 6d.

STRAWBERRY PLANTS.—Selected Crowns for fruiting this year; British Queen, Pauline, Salcro, Vicomtesse St. Hary, Duke of Edinburgh, King of the Earths, Sir Harry, Dr. Thurg, President, The Captain, and other new and extra sorts, 3s. per 100.

S. SHEPPERSON, Florist, BELPER.

EMPIRICISM, OR RATIONALISM. (Continued from p. 321).

IN continuation of our remarks, it may be said that, admitting that natural indications fail in a very large proportion of cases, they do not fail us in all. Political geography is, of course, of little or no use to us, but physical geography often yields the most valuable assistance. It is not of much consequence to us as cultivators whether a plant comes from Sahara or Sind, from Australian or African deserts, the conditions are the same in both cases. We may here mention a circumstance told us by Mr. Williams on visiting his nursery at Holloway recently, and relating to experiences with Heliconia striata aurea. No one has succeeded with it in a pot, and yet it is a plant of great promise from a decorative point of view, with bright looking, massive foliage, and of good habit. It had generally been grown in heavy loamy soil principally, and had grown very sparingly, never reaching much more than 1 foot or so in height, and the leaves, which greatly resemble those of a Musa, got brown first at the tips and gradually dwindled away, so that as a decorative subject it was useless. A friend in the Amazon region wrote to Mr. Williams that the Heliconia grew in humus chiefly, and was found in wet more often than in dry places, by the sides of streams, &c., and reached a good height. Here was a hint that was quickly made use of by the nurseryman, and with excellent effects.

Philodendron Lindenii is another plant of which the above remarks hold good—planted in heavy, sandy soil, it would make leaves about 3 inches in diameter, and its stems ramble very moderately. But put into a pot of light stuff, such as is employed for Orchids, and allowed to attach itself by its aerial roots to a conical pillar of the same materials contained within a framework of rabbit proof wire the plant now makes leaves 10 times larger than before, and rambles quite as vigorously as do P. lacinum and P. pertusum when planted out in light mould.

Turning to the indications furnished by the plant itself, we find that the nature of the roots, the presence or absence of pseudobulbs, the formation of winter-buds, the evergreen, or deciduous character of the leaves, their texture, substance, and internal conformation, the characteristics afforded by their pubescence, and a host of other indications, often prove most valuable as guides to the cultivator, as pointed out by Professor Foster, and specially by Mr. Veitch in his classical lectures on Orchids and Orchid cultivation. They are not infallible, it is true, but they are so obvious, that every intelligent gardener acts upon them; but imperfectly, and this for two reasons, one that he does not know enough about them, the other because he does not know how to apply the knowledge he possesses.

But let us take another illustration and enquire what are the plants which are likely to thrive out of doors in a town garden, surrounded by manufactories, and veiled almost constantly in thick smoke, which is deposited even on the foliage of greenhouse plants like soot? We have had the opportunity of experimenting in such a garden for several years in succession, and we have a long list of successes and failures.

The natural indications show very clearly the reason of the success—we are alluding more particularly to evergreens. In almost all cases the epidermis is thick and glossy, so that the sooty deposit is washed off by the rains; the chlorophyll is unusually abundant, so that the leaves, in spite of the relative feebleness of the light, are deep green, and give the plants a degree of vigour not possessed by others. German Irises, Carnations, and Hardy Bamboos, for reasons that will be obvious to the botanist, also do well. They possess in fact, those "adaptive characters" which in Nature have relation to the needs of the plant in the struggle for existence.

It may be said, with reference to the experiments made by us in a town garden, that they were "empirical," that we proceeded tentatively and without reference to *a priori* considerations. But this is only partly true. We found that Hollies, Ives, and Aucasas thrive relatively well, and hence we deliberately selected plants from Japan, New Zealand, and Chili, possessing similar characteristics, and these plants have mostly succeeded in maintaining themselves, where others less well equipped for the struggle have refused to grow. There are exceptions, it is true. Rhododendrons whose leaf-structure would seem to render them suitable for our purpose, refuse to grow; they dwindle and die, more, as we think, from unsuitable soil than from any other cause. Hypericum calycinum, again, which we hoped might succeed, soon succumbed; but these failures do not invalidate the statement that the plants have a struggle to maintain under cultivation, and that, according to the nature of their organisation, they are enabled to hold their own with more or less success, just as is the case in Nature.

In cultivation, this struggle, in the opinion of Mr. DYER, is "in abeyance altogether." But is not this, again, too absolute? The struggle in which the plants are engaged in the Royal Gardens, Kew, against the smoke of Brentford, may not be precisely of the same character as that to which the plants were subjected in their native localities; but it is obvious that there is a struggle nevertheless, and a severe one too. It is not, as in Nature it so often is, an interminable conflict between plant and plant, but a resistance to the common enemy.

Mr. DYER throughout his article speaks more from the point of view of the practical gardener than from that of the biologist. He is,

of course, amply entitled to choose his ground, and would be listened to with respect on whichever side he happened to plead. For our own part, if we may venture to say so, we should have been better pleased to see him occupying a judicial position in this matter. No one is so competent as he, no less from his personal ability than from his singular command of opportunities, to strike a fair balance between the arguments from empiricism and rationalism.

As it is, we fear the general impression from Mr. DYER'S teaching among the coming race of gardeners, will be that science and research go for nothing in gardening, that experience is everything, and that we shall have the old fallacy about an ounce of fact being of more worth than a ton of theory trotted out, all the more complacently in that it will be assumed to be supported by the high authority of the Director of the Royal Gardens at Kew.

Mr. DYER himself recognises such a possibility, but, of course, would not assent to any such proposition. The gardener, he says, "must know the meaning of what he is looking at." This, of course, implies some considerable amount of scientific knowledge; without it, how could he interpret a single iota of what he sees?

Mr. DYER has himself inadvertently furnished us with an excellent illustration of the value of rational knowledge, though he has used it for the opposite purpose. "A knowledge of osteology," says he, "will not enable a man to treat a case of typhoid fever." Of course it will not; but suppose the practitioner to be, as his forefathers were, unaware of the existence of Peyer's glands, he would be equally unable to treat the case rationally. On the other hand, suppose him not only to know of the existence of these structures, but to be aware of their fateful significance as regards typhoid fever, he could then treat that disease on rational principles. The modern practitioner does so in fact, and the diminished mortality shows with what good results.

In point of fact, it is not science or *a priori* knowledge that is helpless to us as cultivators, it is ignorance which blocks our road to success; positive ignorance of what is essential, as well as ignorance of the limitations imposed by Nature. This negligence it is which leads us to make efforts doomed of necessity to be futile, and which we shall cease to make the moment we know better.

How shall we combat this ignorance? For a long time to come, by empirical methods. We shall have no other resource. But, while bowing to necessity, let us not be oblivious that there is a better way to be found, and towards the attainment of which every gardener should, according to his means and ability, contribute. The services of the biologist, the traveller, the meteorologist, the chemist, the physician, should each and all be enlisted and utilised as occasion demands or opportunity offers. Empiricism is at present in many cases our chief or our only resource, but we should only look upon it as a temporary expedient, destined to be superseded gradually but surely by ever increasing knowledge and ever augmenting power of turning it to account.

The essence of successful cultivation lies in the timely adjustment of the balance between different factors acting under varying circumstances, and operating on diverse structures. This at present is mostly arrived at by rule of thumb, haphazard procedures, or by transmitted experience originally founded on a similar unsatisfactory basis.

Much of the garden practice of our predecessors was sheer quackery, most of the practice of

the present day is of necessity empirical. We acknowledge the fact, we bow to the inevitable; but we also recognise the truth, that every real advance in knowledge, however slight, every body of facts, rightly co-ordinated, tends to the overthrow of empiricism, to the consolidation and extension of a rational basis for horticultural practice, and to the extension of our control over plant life. The full attainment of the ideal must be beyond our powers—is Utopian—but every step towards it is a gain which begets others, and the result is not a mill-track circuit, but a real and constant progress.

NEW OR NOTEWORTHY PLANTS.

ZYGOPETALUM (BOLLEA) WHITEI, Rolfe, n. sp.*

A PECTY creamy-white *Zygopetalum* belonging to the section *Bollea* has been twice sent by R. B. White, Esq., of Ardarrook, Gairloch Head, Dumbartonshire, which I fail to identify with any described species, and for which I therefore propose the above name. It was introduced by Mr. White's collector from New Granada, where it was found growing amongst *Cattleya labiata* var. *Mendeli*. Judging from the materials sent, it seems to be a vigorous grower, but whether this arises from its having received the proper treatment, or from a more than usually robust constitution, it would be difficult to say. The species are generally considered difficult to cultivate successfully for any length of time, but it is to be hoped that this difficulty may in time be surmounted, for they are quaint in structure, and their somewhat unusual colours are in several cases very attractive. The creamy-white segments of the present one, and the golden-yellow disc, form an elegant contrast. It stands nearest to *B. heximixanta*, Rehb. f., which is described as having numerous small warts and styloid processes at the base of the lip. These are absent in the present species. *R. A. Rolfe.*

ODONTOGLOSSUM WATTIANUM, Rolfe, n. hybr. ††

This is a very handsome *Odontoglossum*, though whether a natural hybrid or a distinct species would perhaps be difficult to decide at present. On the whole, however, I incline to the former view. It bears so strong a resemblance to one or two natural hybrids which undoubtedly have *O. luteo-purpureum*, Lindl., for one parent, that I cannot help thinking it comes from the same species. The other parent is not so obvious, but from a variety of considerations, I think it may have been *O. Lindleyanum*, Rehb. f. The lip is stalked, the apex acuminate, and the column rather long, all of which charac-

* *Z. Vogel et al. in Bollea Whitei, Rolfe, n. sp.*—Leaves narrowly ovate-oblong, acute, 10 to 11 in. long, 1½ to 1½ in. broad. Sepals much shorter than leaves. Bract cucullate, oblong, obtuse, ½ inch long. Flowers 2½ in. in diameter. Segments lance-oblong, acute, a little undulate, the lateral sepals broader than the rest; colour creamy-white, with the adjacent halves of the lateral sepals light yellow. Lip broadly cordate-orbicular, the front margin reflexed, and the apex shortly and abruptly reflexed; colour light yellow, with large golden-yellow disc and about fourteen or sixteen indistinct keels, but no rugosities of any kind behind. Column ½ inch broad at base, creamy-white deep golden-yellow at base in front.

†† *Odontoglossum Wattianum, n. hybr.*—Pseudobulbs ovoid, compressed, slightly furrowed, bright green when young, dull purple-brown with age, apophyses. Leaves parallel, acute, 3-4½ in. long. Scape (at present) 16 inches long, slightly arching, and with four to five flowers. Flowers 3½ inches from tip of dorsal sepals to tip of lateral ones. Sepals lanceolate, acute, clear yellow, with large chestnut-brown blotches, smaller towards base. Petals a little smaller, and more acute; spots smaller, and more numerous. Lip broadly oblong, acuminate, yellow, with the blade but little reflexed; colour creamy-yellow, with a large oval chestnut-brown blotch above middle, and with numerous small blotches behind; crest consisting of two large irregularly toothed white keels, with several smaller ones. Column long, creamy-yellow, with red dots in front, wings elongate, acute, slightly toothed below. *R. A. Rolfe.*

ters would be expected to occur in such a hybrid, and as the two species grow together, such an one was likely to appear sooner or later. On the other hand, there are four or five plants which are said to have the same character, but these may be subdivisions of one original plant, or seedlings from the same seed-pod; otherwise, the fact might be cited as one that told against its hybrid origin. It was imported by Messrs. F. Sander & Co., of St. Albans, during 1888, and flowered in December 1889. It is dedicated by request to R. Watt, Esq., of The Briars, Chislehurst. The materials to hand consist of two pseudobulbs, a leaf, a single flower (carefully dried), and an excellent sketch with analytical details. I should not like to say that it may not prove a distinct species, as has been supposed, though at present the chances seem against it. I believe a figure will shortly appear in the *Reichenbachia*. R. A. Rolfe.

earlier than plants from seeds sown in the open air. H. W. W.

ANTIRRHINUMS.

Although the plants may be usually blooming a year after sowing in July and August, it may by sowing seed in heat at the present time, and pricking off the seedlings, be bloomed by the month of August next. The Tom Thumb strain is a useful one for small beds, and consists of numerous pretty colours. The best of these may be increased by cuttings, struck in a cold frame in the autumn, or in heat in the spring. Although Antirrhinums will flower when grown on the poorest soils, and on old walls, they do so with greater profusion in a soil that is fairly rich, and this is true especially of the majus type. An open, sunny spot, that is well drained, suits them. H. Mackham.

(1850—51), p. 60, fig. 38; *Jl. Gard. Chron.*, 1864, p. 1202; *Bot. Mag.*, t. 5553; *Gartenflora*, t. 698; *Fl. des Serres*, t. 2473; Warn. and Will, *Orch. Alb.*, iii., t. 123. *Bletia grandis*, Rehb. f., in *Walp. Ann. Bot.* vi. (1861) p. 424. — Brazil. Introduced in 1849 by M. Pinel, from the neighbourhood of Bahia, in Brazil, plants being sent to M. Morel, at Paris. In the following year it was exhibited at one of the London shows. It appears to have been lost sight of again until 1864, when Messrs. Low & Co. received a few plants from their collector at Bahia; it was also received at Kew about the same time from the same port. It is believed to inhabit the hot and humid district around the Bay of Todos os Santos. R. A. Rolfe, *Herbarium*, Kew.

(To be continued.)

CULTURAL MEMORANDA.

THE BALSAM.

To grow this fine plant well, seed should now be sown singly in pots of a light rich compost of sandy loam and leaf-mould. The seeds may be put a quarter of an inch deep, the soil well watered, and then be placed in a mild hotbed. As soon as germination takes place, the pots should be brought near to the glass, air being admitted as liberally as the weather will permit, shifting the plants into larger pots as fast as the roots touch the side in quantity. The potting soil should consist of three parts loam and one part horse-droppings and leaf-mould, and the potting be firmly done. The plants must not suffer from want of water after the roots have taken good hold of the fresh soil; and all flowers should be picked off until within three weeks or a month of the time at which they are desired to be in bloom. Syringe the plants at closing time during growth, and even after that period (July and August), and afford them free ventilation day and night, so as to secure sturdiness, and keep them clear of red-spider.

ERANTHEMUM FULGEBULUM.

This pretty stove plant, with spikes of Phlox-like blue flowers, is one that is easily grown, but much neglected. Cuttings may be taken now, and put singly in 3 inch cutting pots filled with light mould with a surfacing of silver sand, and placed in a Melon-frame, or any other place where there is a warm and moist temperature of about 70°. When rooted, the points of the shoots may be pinched out twice or thrice, shifting the plants into 18's and 32's as they require space. These spring-struck plants will be very useful for decoration in autumn and early winter. During the summer the plants may be grown very well in a shallow pit or garden-frame, keeping them close for a few days after each rooting, and damping them overhead when closing the frame for the day. When the pots become filled with roots, great injury will be done if the soil should get very dry. H. W. Ward.

EARLY MIGNONETTE.

If a pinch of Mignonette, of any approved variety be sown at once in a shallow and narrow box, having a few holes in the bottom with pieces of potsherds over them, filled with light mould, and if the seeds be covered slightly, the soil being pressed firmly with a piece of board, and placed in warmth, it will soon germinate.

As soon as the plants appear, the box should be put into a house or pit having a night temperature of 50° to 60°, and be given a position near to the glass. The seedlings should be pricked out into similarly prepared boxes 2 inches apart, before they get crowded, and should be shaded until the roots have taken to the soil, after which they should be gradually hardened off, and be transplanted carefully to a warm border at a space of 15 inches apart. Thus treated they will flower with great abundance,

LIST OF GARDEN ORCHIDS.

(Continued from p. 334.)

LILIA.

(14) *L. atava*, Benth., in *Journ. Linn. Soc.*, xviii. (1818), p. 214; Benth. and Hook. f., *Gen. Plant.*, iii., p. 324; *Orchidophil.*, 1889, p. 313, with plate. *Bassivula glauca*, Lindl., *Bot. Beech.*, xxv. (1839), *Misc.*, p. 47; *Fl.*, xxvii., t. 14; Batem., *Orch. Mex. & Guat.*, t. 16; *Bot. Mag.*, t. 1933; *Orchidophile*, 1888, pp. 88, 89, with fig. *Bletia glauca*, Rehb. f., in *Walp. Ann. Bot.*, vi. (1861), p. 432.—Mexico and Guatemala. Originally sent to England by a Mr. Henchman, from the neighbourhood of Xalapa. Afterwards Hartweg met with it in the same locality, and sent plants to the Horticultural Society in 1837. Mr. G. Ure Skinner also found it in Guatemala, growing on Oaks, in company with *Onopidium maculatum*. (See fig. 52, p. 357.)

(15) *L. GODEFRIDA*, Rehb. f., in *Gard. Chron.*, 1888, pt. 1, p. 11; Sander's, *Reichenbachia*, ii., p. 23, t. 59. Warn. and Will, *Orch. Alb.*, viii., t. 371. Mexico. Recently introduced by Messrs. F. Sander & Co., of St. Albans, and named after Mr. Jay Gould. It was at first thought to be a natural hybrid between *L. autumnalis* and *L. anceps*, but the character of the former altogether preponderates, and I doubt whether it is more than a distinct variety of that species, which is certainly more polymorphic than at first supposed. It appears to have been imported in considerable quantity, but some plants of the importation have proved on flowering to be ordinary *L. autumnalis*.

(16) *L. GAVALENSIS*, Lindl., *Gen. & Sp. Orch.*, (1831), p. 115. *Bletia speciosa*, Kunth, in Humb. & Bonpl., *N. Gen. & Sp.*, i. (1815), p. 342. *Bletia grandis*, Sw., *Flav. & Lex.*, Nov. *Veg. Dresd.*, ii. (1822), *Orch. Opus.*, p. 47; *Calliopsis Grahamii*, Lindl., *Gen. & Sp. Orch.*, (1831), p. 116. *L. purpurata*, Lindl., *Bot. Beech.*, xxv. (1839), *Misc.*, p. 35; *Fl.*, xxx., t. 39; Batem., *Orch. Mex. & Guat.*, t. 23; *Paxt. Mex. Bot.*, six, p. 1, with plate. Junb., *Gard.*, t. 11; *Bot. Mag.*, t. 5567; *Gard. Chron.*, 1883, pt. 1, p. 628, fig. 191; Warn. and Will, *Orch. Alb.*, viii., t. 372; *Bely. Hort.*, 1869, p. 129, t. 9; *Lindleya*, iv., p. 95, t. 190.—Mexico. Introduced about 1837, being sent by Ross to Mr. Barker, of Birmingham, and by Hartweg to the Horticultural Society of London. It flowered in the collection of Mr. Llewelyn, at Penllengere, near Swansea, in 1839. It is widely distributed over Southern Mexico, generally occurring at a considerable elevation, and is called by the natives *Flor de Mayo*, or May Flower, in allusion to its time of flowering. The plant appears to have been known very early in the 17th century, as it is mentioned by Hernandez, in his *Natural History of New Spain*, in 1615. Singularly enough Lindley named the plant three times over. It and *L. autumnalis* were the two species on which the genus was founded, and yet the name *L. grandiflora* seems to have been quite a lost sight of.

Var. *alba*, Rehb. f., in *Gard. Chron.*, 1880, pt. 2, p. 588. A pure white variety. See also *Gard. Chron.*, 1877, pt. 1, p. 790.

(17) *L. GRANDIS*, Lindl., in *Paxt. Fl. Gard.*, i.

VEGETABLE PRODUCTS IN ADRIANOPLE.

In a recent report on the products of Adrianople, it is stated that the growth of canary seed is peculiar to Turkey in general, but especially to the district of Kodosta, and that it requires a deep but light soil. Owing to the remunerative results, a moderate yield being twenty-fold, it is extensively cultivated wherever the soil is suitable, and in many localities it forms the sole object of culture; whilst in others, notably Adrianople, a steady advance is visible. Great care has to be taken as to the choice of time for sowing, and a long drought proves fatal to the entire crop. Millet is grown extensively as a favourite food for horned cattle and fowls. A beverage called "boza" is also made from this seed. The yield is very abundant, reaching as high as forty to fifty, and sometimes a hundred-fold. Aniseed is grown in the Gallipoli region, and serves in the making of the native brandy, called "mastic." It is exported to France for mixing with various liqueurs, notably anisette. On account of the increasing demand, the cultivation of this plant is developing.

The cultivation of Tobacco is perhaps the most important branch of agriculture after that of the Vine, and is the most lucrative; whole districts are given up to its culture. In what is called the Adrianople district, three kinds or qualities of Tobacco are found, the first worth a little over 5*l.* per lb. to the grower, the second a little over 3*l.* per lb., and the third at 2*l.* per lb. The annual produce is estimated at about 20,000 cwt., which does not comprise the contribution of Kodosta and Gallipoli, which is 6000 to 7000 cwt. The most famous leaf is that of Xanthus, which is not included in the above, and where about 30,000 cwt. are annually gathered; certain fields of known villages provide the finest qualities, and the owners of these fields are known in the same way as those of famed vineyards are known to the wine trade of France. The best Tobaccos are made up into very small bales called "Ghiobek boktelias," at a cost of about 3*l.* per lb. to the purchaser, to be exported to Russia, Austria, Roumania, and France; but the largest quantity is consumed in Turkey. Trials in the cultivation of Xantho Tobacco are said to have been made in Russia and Asia Minor, but without success.

DAFFODIL SIR WATKIN.

In the first decade of the present century a mining captain named Byers came from Bileford, in Devonshire, into Merionethshire, to manage a lead mine near Dinas Mawddwy. He settled at a place called Pen Dyffryn, and brought with him from Devonshire some Daffodil bulbs, which he planted in his garden. These were of the kind now known as Sir Watkin, and persons are still living near Dinas Mawddwy who recollect the time when these grand Daffodils were known only in the little garden at Pen Dyffryn. By degrees a few appeared in neighbours' gardens, and when captain Byers, after leaving Pen Dyffryn, died at Dolgelly at the age of seventy-

five, about the year 1845, they were to be seen before many cottages near Dinas. In 1868, Mr. Pickstone went to live at Plas-y-bont, a villa four miles from Dinas. There he found some of these Daffodils in the garden, and when he went a few years afterwards to live near London, he took them with him, and sold the flowers to London florists; but he does not seem to have parted with any of the bulbs, and when he went to live at Maesmyan, near Caerwys, in Flintshire, he transferred them all to his new garden. After this he sent some of the flowers every year to Manchester, where they at last attracted notice. Mr. Alfred Dickson, of Chester, saw them in 1884, and at once entered into negotiation with Mr. Pickstone for as many bulbs as he would part with. Mr. Pickstone sold them all, 10,000 in number, and Mr. Dickson took possession of them when ripe, at the end of the summer of 1884. In the autumn of 1885 Mr. Pickstone sent 3000 more, which, as Mr. Dickson found, had been obtained from gardens near Dinas Mawddwy. Mr. Dickson, being anxious to obtain the whole stock sent in the following spring a foreman into Merionethshire to search for the bulbs whilst in flower, and in that year obtained 10,000 more, buying up all he could find. The total cost of becoming possessed of these 23,000 bulbs was nearly £1000. This is perhaps about the largest amount ever paid for the stock of one plant.

Such is the history, as far as it is known, of this famous Daffodil, which for the two qualities of size of flower and vigour of growth, is still unsurpassed in the incomparabilis section. The account here given may be accepted as authentic, as Mr. Alfred Dickson, of Chester, has very kindly supplied me with all the information he has, and has sent me some original letters in English and Welsh, from which I have collected these facts. Mr. Dickson also told me that of all the 23,000 he knows of only one which has varied from the type; this was one of a 100 sold to Mr. James Walker, and had a crown of orange colour. Mr. Dickson concludes that it was a sport, because although he has dusted the flowers with the pollen of many different Daffodils he has never been able to obtain a fertile seed from any pod of Sir Watkin. *C. Wolley Dod, Edg. Hall, Malpas, March 10.*

THE APIARY.

BEES AND FRUIT BLOSSOM.

MEEN is said on this subject, but there still seems something to learn about it. We have come across two diverse opinions in the last week. First, the one for it. Mr. L. Wren, of Lowestoft, says that last year he had about thirty stocks of bees in a large garden at Beccles; there were many fruit trees in this garden. Just at the time when the trees were in full bloom came a very cold east wind, and the bees could only get a very little way from home. They, however, managed to get into the flowers close at home, that is, those just round the hives. The consequence was strange. All those trees which stood close to the hives were loaded with fruit, while those further off had very light crops. From this we gather that, the weather being warm, the bees would have worked all the blooms on all the trees, but, being cold, they could only work on those close at home. This seems to be very conclusive evidence, if any were required in favour of the bees.

The other instance comes from Kent. There, it seems, that a certain farmer wished to turn a poor woman (his tenant) out of house and home because, forsooth, her bees had been amongst his Strawberry plants, and of course done him a lot of harm. We should like to know what it is that does *not* work against farmers and farming in our days. It would seem as though all creation were united in one great effort to undo the farmer. I cannot say whether the farmer carried out his threat or not, but it only shows that ignorance is still rampant in many country places.

By the time this reaches the public eye, it will be time to begin gently feeding with *syrup* those stocks which are deficient in stores. It is generally quite safe to feed with syrup about the third week in March, but it is safer to go by the doings of the bees themselves than to do anything at fixed dates. If the bees are flying generally, that is most days of the week it is perfectly safe to give them syrup, otherwise it is unsafe, and probably, or at any rate possibly, dysentery may follow. Appliances ought to be looked to now, and preparations made for swarms, should they determine to issue, and other contingencies.

If the bees have enough food, let them entirely alone, as the less interference the brood nest has at the present the better. I have always found that those bees which do not require feeding at all give the best results. *Dee.*

LELIA GLAUCA.

ORIGINALLY introduced into our gardens under the name *Brassavola glauca* more than fifty years ago, and since that time frequently brought over with other Mexican and Guatemalan Orchids, this fragrant species (fig. 52), has been received into most collections of Orchids at some time or other, but it cannot be said to have ever been a favourite, as under the treatment it was invariably subjected to, that is, placed in too high a temperature, it got in some gardens the name of being a bad grower, and in most of being a shy flowerer. In a few instances, however, where the plant has been grown in a basket suspended in the house with *Lelia anceps*, *Lelia autumnalis*, &c., it has grown satisfactorily, and produced its large flowers with freedom. These latter have pale green sepals and petals, and a pure white lip. Its pseudobulbs, or stems, are monophyllous, of a greyish-green colour, but they are not so distinctly glaucous as its larger growing and nearest ally, *Lelia Digbyana*, which also has an extraordinary development of fringing round the lip, and was the plant from which, by crossing with *Cattleya labiata* Mossie, Messrs. James Veitch & Son succeeded in getting their beautiful hybrid, illustrated in these columns, p. 657, May 25, 1889.

ORCHID NOTES AND GLEANINGS.

PHALENOPSIS HARRIETTEÆ.

A TWO-FLOWERED raceme of this beautiful hybrid has just been received at Kew from Erastus Corning, Esq., of Albany, U.S.A., and in spite of its long journey, is as fresh as if cut from the plant only the previous day, thanks to careful packing. The plant has gained strength under Mr. F. Goldring's care, and the flowers show a marked improvement since they were originally described and figured in these columns (July 2, 1887, p. 8, f. 1). It is certainly a great horticultural acquisition. It will doubtless be remembered that it was raised by Mr. Seden in the establishment of Messrs. James Veitch & Sons, of Chelsea, out of *P. grandiflora* by *P. violacea*. This is the original plant, but I believe there are one or two others in existence. Probably few hybrids show their greatest possible development on the occasion of their first flowering, the vegetative organs not having then attained their maximum development. *R. A. Rolfe.*

A REMARKABLE PHALENOPSIS.

There was recently in flower one of the grandest specimens of *P. Schilleriana* it has been my lot to see. The happy possessor is Fredk. Scholes, Brookland, New York, an ardent patron of horticulture, who gives the following description and history of the plant:—The original plant, which possessed one small growth when bought for one dollar eight years ago, now has three immense growths and twenty-one leaves, the largest measuring nearly 18 inches in length, and there are nine

flower-stems, the longest measuring only 2½ feet, and upon which are 325 fully expanded flowers of medium size, and of a dark colour. It has been named by one of our leading orchidists, P. Schilleriana compacta nana. It was grown in a wire basket from its youth up, and left undisturbed for five years, except an occasional top-dressing of sphagnum moss, in which it is solely grown. Mr. Scholes ascribes his success with the plant to the liberal use of diluted cow-dung, administered once a week during the growing season. It is said that the plant is likely to pass into the hands of Pitcher & Manda, Short Hills, N.J. *Our New York Correspondent.*

MEXICAN ORCHIDS.

M. L. Linden calls attention to the singular fact that Mexican Orchids are relatively easier to introduce than those from Venezuela or Colombia, but, on the contrary, the cultivation of Mexican Orchids is much more difficult than that of those from Colombia. For instance, *O. maculatum*, *O. nebulosum*, *O. maxillare*, &c., are rarely well grown; whilst *O. crispum*, *O. luteo purpureum*, *O. triumphans*, are usually well cultivated.

ORCHIDS AT MESSRS. J. LAING & SONS.

At the Forest Hill Nurseries there are some few interesting Orchids in flower at the present time. *Odontoglossums* are represented by several species, forms of *O. crispum* and *O. Rossi majus* are plentiful, also *O. aspersum*, *O. pulchellum* and *O. Cervantesii*. In the Orchid-house is an effectively arranged bank, which contains some finely flowered pieces of *Dendrobium Wardianum* in good forms, *D. nobile* and *D. n. pendulum*, *D. crassinode*, and others. Some of the varieties of *Cattleya Triana* here were very good forms, including *C. T. Warzewiczii*, with a fine breadth in all the delicate lilac rose segments, the prominent lip well coloured on the median lobe. *C. T. marginata*, recently cultivated, is a very pretty form, with pale rose sufficed petals and sepals, the lip is bright crimson with a pale mauve crested fringe. Another approach *C. T. Backhousiana*, the fringe is quite dark, and there is the peculiar veining at the tips of the petals. *Laelia harophylla* and *Phaius grandiflorus* were also in flower. In the pits we saw, among other things, an apparently vigorous stock of that fine old favourite *Leschenaultia biloba major*.

CYMBIDIUM FERNSEUM.

A fine plant in a 12-inch pot of the above Orchid is now in full beauty in Mr. Hodgson's garden, Lytch Hill, Haslemere. It possesses twelve growths and twenty-seven flowers. Mr. Evans grows the plant in rough peat, and gives good drainage to the pot, and waters it liberally in the growing season. The *Cymbidiums* are grown in the Mexican-house, and the treatment afforded it there seems to suit it better than when a temperature higher than that given to Mexican orchids is given. After growth is made, the plants are stood with *Odontoglossums* in a cool house.

FLORISTS' FLOWERS.

THE RANUNCULUS.

ARE the beautiful forms of the Asiatic Ranunculus to be allowed to die out of our midst? I am afraid it has become very difficult to obtain both roots and seed of the fine type which made the names of Tyso and others so famous in a past generation. The most recent collection of Ranunculus I have seen growing was in Mr. Samuel Barlow's garden at Stakehill House two or three years ago. Possibly there are others about the country who grow a few, but they are rarely heard of. At some provincial shows held during the month of May, it is customary to offer prizes for flowers of Ranunculus, but they appear to be waxing poorer year by year. A revival of interest is much needed in this flower, and in the showy *Anemone* also. It is true

that one can find in bulb catalogues mention made of named superfine Persian Ranunculus, and superb Scotch varieties, and they are probably grown, and it is not unreasonable to suppose there are good things among them; but it is found in practice that unless some close attention be given to the roots

with that might lead to the acquisition of a few varieties of his own raising of some merit.

Seed can be sown early in the month of March. It is readily raised when the seed is good. A fairly shallow wooden box can be filled with rich soil, and the latter made level at the top, and then watered

sprinkled over them, just enough to cover them. As they grow into size they can be pricked off into other boxes, if necessary, though this is best avoided. The boxes can be stood out in the open in May, and by the end of June, the foliage having died away, the roots can be taken from the soil, and

FIG. 52.—*LALLIA GLAUCA*: SEGMENTS GREENISH, LIP WHITE: FROM A SKETCH BY MR. WEATHERS. (SEE P. 356.)

after they have done flowering, they soon dwindle away, and there is no doubt many roots that are annually planted are so lost.

I should like to see attempts at raising seedlings, though any effort in that direction should be made only with the best seed that is procurable. If a collection of named Persian varieties were obtained, some seed could be taken from the best of them, and the operator would thus have something to commence

through a fine rose watering pot. Then the seed, which is of a soft fluffy character, should be sown over the surface as thinly and regularly as possible, a feather being generally employed for the purpose. The box should then be covered with glass, and be kept in the shade to prevent the seeds or soil from being dried by wind or sun. In about a fortnight the seeds will begin to germinate, and as soon as they put forth growths, a little fine soil should be

put away carefully to plant out to bloom the following season. *R. D.*

"ORCHIDS, THEIR CULTURE AND MANAGEMENT."—This useful treatise, edited by Mr. Watson, has reached its tenth part, the genera mentioned being *Renanthera*, *Restrepia*, *Saccolabium*, *Schomburgkia*, *Leucaria*, *Subralia*, *Sophrontis*, and *Spathoglottis*.

NURSERY NOTES.

MESSRS. JAS. VEITCH & SONS, CHELSEA.

The brighter weather has caused an entire change in the flowering Orchids at this great establishment. The fine display of *Cattleya Trianae*, *Dendrobium nobile*, and of *Cyclogyne cristata*, now nearly over, has given place to another, that of *Cypripediums* in great variety, some good forms of the pretty and fragrant *Cattleya Schroderae*, and others which usually flower at this season. The rockery is gay with *Cymbidium Lowianum*, a noble specimen; some sturdy specimens of *C. eburneum*, and with perhaps the largest and most vigorous plant in the country of the old but much-prized *C. Devonianum*. This plant has four fine drooping sprays of white and purple flowers. Here, too, are several showy specimens of the fragrant *Bifrenaria Harrisonii*, with two or three dozen flowers on each; *Lycaste fulvescens*, with over thirty flowers; many *Lycaste Skinnerii*, and among them a giant form of the pure white variety, with superb white flowers, being 7 inches wide at their greatest width, the sepals and petals having each a breadth of 2 inches. Several of the best type of *Dendrobium Farmeri* were in bloom, many of *D. Wardianum*, *D. crepidatum*, a charming new light form of *D. nobile*; the handsome *Ocycidium tetrapetalum*; the best exhibition form of *O. sphaclatum*; many *O. sarcoodes*; several *Epidendrum Wallisii*, *Lycaste costata*, a large specimen of *Cyclogyne cristata alba*; the strong growing and handsome pure white *Calanthe veratrifolia* var. *australis*, *Maxillaria luteo-alba*, *Cyclogyne Massangeana*, *Chysis Limninghi*, the elegant *Pholidota chinensis*, and the curious *P. ventricosa*; some elegant plants of the white and fragrant *Platyclinis glauca*; the noble and richly-coloured *Maxillaria Sanderiana*; the fine hybrid *Cymbidium eburneo-Lowianum*; some splendidly flowered *Ocycidium ampliatum majus* and *Phajus tuberosus*, and many other rare species which look to great advantage arranged on the rockeries or suspended overhead.

The *Cypripedium*-houses have in flower the new *C. Numax* (*C. Stonei* × *C. Lawrenceana*), *C. Othelloi* ×, the curious *C. Atys* ×, a very distinct *C. Hookerianum* cross; *C. Lathamianum* ×, which increases in beauty as it gains in strength; *C. Petrei*, *C. Porphyreum* ×, *C. Sedeni* ×, and the chaste *C. S. candidulum* ×, *C. cardinale* ×, *C. Williamsianum* ×, *C. villosum aurum* and *C. Boxalli superbum*, *C. hirsutissimum*, *C. Elliottianum*, *C. venustum* ×, *C. Seligerum majus*, and numerous forms of *C. argus*, and *C. barbatum*.

The *Phalaenopsis Schilleriana* and *P. grandiflora* had some good sprays; and plants of *P. leucorrhoda* and *P. casta* were in bloom. *Vanda coarulescens*, *Saccolabium Harrisonia*, the rare *Angraecum fastuosum* and other *Angraecums*, *Miltonia Roezlii*, &c., were noted.

The cool-houses are bright with clumps of scarlet *Sophronitis*, and many fine sprays of that finest of coloured *Olozotoglossums*, *O. triumphans*, mingled with the elegant white-flowered spikes of *O. crispum* and *O. Pescatorei*, and the soft tints of some of the hybrid forms.

HIPPEASTRUMS.

Nothing could exceed in beauty peculiar of its kind, the houseful of the above-named plants at this nursery. The foliage appears to be much finer and longer than we have hitherto seen it, an improvement which is due to the mild winter and freedom from fog enjoyed by London since growth began. The flower-spikes bristle more numerous than in former years, promising therefore a prolonged display. Every day brings out some new beauty, some improvement perchance as regards form or colour, which the hybridiser, Mr. Heale, who is constantly watching for new materials for hybridisation, jots down in his note-book. The parentage that was once traceable to *H. pardinum*, *H. Ackermannii superbum* (Garaway's hybrid), *H. Leopoldi*, and *H. Empress of India* is now very much mixed owing to intercrossing.

The following were some of the finer bulbs in flower on March 17: *Illustrious*, a purplish-crimson—quite a new colour, with scarcely any trace of green at the base; *Armata*, a scarlet-crimson, with a feathering of deeper colour in the middle of each segment towards the base; *Dromo* is of brilliant scarlet, with a green stripe at the base—regular and smooth form; *Cicero* is blood-red, with a green base; *Champion*, a flower of last year, a magnificent crimson—measures 10 inches in diameter, the lower segment being 2½ inches wide, and the upper 3½ inches; *loo* is a fine white, with scarlet stripes and flakes, the segments also well reflexed—a pleasing style of flower; *Abeona* and *Phedra* are similar to the above; *Lacinia* is a white, with a few crimson lines. It is possible that the total number of flowers this season will reach 2000.

TRADE NOTICE.

MACKETT'S ORCHID BUREAU. — Mr. F. C. Mackett, of St. Albans, has opened an establishment to serve as a medium for the exchange or sale of duplicate plants. A list of plants offered, and a corresponding list of plants wanted, is printed and circulated every week, and is likely to be useful to amateurs.

PLANTS AND THEIR CULTURE.

SOME INMATES OF THE STOVE AND INTERMEDIATE HOUSE.—Tubers of *Gloxinias* may now be started as a succession to the earlier started ones. If late autumn bloom is required, some of the tubers should be reserved for that purpose, and plants raised from early sowings will follow these, and prolong the flowering period of *Gloxinias* to the end of the year. Tuberos-rooted *Begonias* should now be started, as some of them will have begun to grow. Good loam should be used in potting, an over-potting avoided, giving them but little water till growth commences; a warmth at night of 50°, and by day of 60°, will suit them. *Anaryllis* as they go out of bloom may be repotted, if the pots be very full of roots, otherwise this operation is better done previous to growth beginning. They should occupy a sunny position, *Valloia purpurea* may also be repotted if the soil be sour, or the drainage of the pots defective.

The *Greenhouse*.—More water will be required by plants in this house, and shading for some of the plants. The ventilation on mild or bright days must be abundant, but the house may be closed rather early, so as to economise warmth as much as possible. Any plants wanting a shift into larger pots should, after potting, be kept rather close at the warmer part of the house for a time. Temperature, 45° at night; 55° by day, or higher during sunshine—but if easterly winds prevail, the ventilation will require much care. Means should be taken to prevent mildew spreading among New Holland plants and on *Statice*, by dusting affected plants with flowers-of-sulphur. A few of the latest of the *Cinerarias* may be retarded by being placed in frames with a northern aspect, and these will be benefited by occasional waterings with liquid manure. *Cinerarias* should be kept very clean. *Primulas* of the duplex flowered sections may be kept drier at the root after having bloomed, thus preparing them for division of the roots. We place a little sphagnum and peat round the neck of these plants and into which roots push freely, and the plants are then split up and put into a close frame early in the month of April. Any special variety of the single species required for seeding should have but one truss of bloom left on it, and be put on to a sunny shelf. *Cyclamen* plants of which seed is to be sowed, may be placed in a similar position, but on these half-a-dozen blooms may be left. The late sown *Cyclamens* should have been put into small pots and kept near the glass, watering them carefully. The warmth of an intermediate house suits young *Cyclamens*.

Herbaceous *Calceolarias* making rapid growth

must be grown close to the glass, or weakly growths will be the result. Any re-potting of late sown plants should be completed, and weak liquid manure given to plants with plenty of water. *Calceolarias* like a cool pit, greenly sown, infesting them in a warm place; fumigate them frequently. A sowing of *Primula sinensis* may be made, and one of *Nicotiana glauca*, *Solanums*, *Globe Amaranth*, *Balsams*, *Rhodanthes*, *Celosias*, *Cockscombs*, and *Schizanthus*. *Mignonette* will be useful, and the variety called *Machet* is good for pots. *Fuchsia* cuttings may be struck to flower late, and old plants may be stopped at the points at frequent intervals, and kept growing freely in a warm and moist house or pit. *Solanum* cuttings should be obtained by cutting back the old plants. Also cuttings of *Salvias* when large plants are wanted, but for small plants cuttings put in during May will do very well.

Repeat old *Salvia* plants after shaking them out if very early bloom is desired. The same operations will apply to *Eupatoriums*. The useful *Francoa ramosa* may be shifted at this time of the year. Any *Bonvardias* cut back recently will soon be able to furnish cuttings, which propagate as soon as they are two inches long. If the stock of the show and fancy varieties of *Pelargoniums* is low, cuttings from old plants may be taken, and these will soon make nice plants. The other plants must be fumigated often, to keep down aphids. Repeat pots for late bloom, and keep all of them close to the light; the plants to follow the early ones may now have the points of the shoots pinched out.

Chrysanthemums should not be allowed to want for moisture, and may be stood in cold frames, protecting them on cold nights, and re-potting the plants as the pots fill with roots. Cuttings of *Labonias* should be now struck, also of *Lilium trigynum*. These plants will require higher temperature in the autumn than most greenhouse plants. *Kalosanthes* may be shifted if that be found necessary, employing loam and a small quantity of decayed manure. Stop the new growth of these plants as soon as the roots fill the pots, and feed them liberally; a low pit or a shelf near the glass will suit them. *Lachenalias*, if in bloom, should get plenty of water, and a cool place in which to flower. *G. Wythes*, *Syon House*, *Brentford*.

THE FLOWER GARDEN.

Roses.—The pruning of all Roses should be completed, as injury from frost is not likely now to occur, although it is yet possible to have some severe weather. The pruning must be determined by the growth of the plant operated on, whether vigorous or weak—if the former, four or five buds or more may be left, according to the size of the head or bush; and if of weaker growth pruning may be much harder, removing also as much of the old wood and weak shoots as would be consistent with keeping enough to furnish a good head—the young growths producing the best blooms. Most Roses require the old growths to be cut away entirely, the young alone being reserved, the tips of which should be cut off before pegging down. A dressing of rich manure should be given Rose beds annually, and if, in addition, loam be incorporated with the manure and forked in, it will much improve the growth of the plants on all kinds of soils.

Winter Protection.—All half-hardy subjects may now be uncovered, including *Magnolias*, *Cinthus*, *Camellias*, *Myrtles*, and the necessary pruning and training attended to, which will put them right for the season.

With Ivy on Walls, the best plan is to trim off closely all the foliage with a reaping-hook, or the hedge-shears. It may look unsightly for a time, but close new foliage will soon cover the wall, and which will give no further trouble during the year. Treating Ivy in this manner gets rid of old leaves, clears out many insects from their hiding places, and removes all danger of having the Ivy torn away by winds.

Evergreens.—These may still be cut or clipped, but this operation should be pushed on, as growth will soon commence. *Rhododendrons* are best pruned now, instead of after flowering; otherwise the young growth does not attain sufficient maturity to withstand severe weather in winter; one season's blooming must be sacrificed in any case; besides growth always commences more readily at this season, and the unsightly effects of pruning are more quickly replaced by young growth.

Pinks and Carnations, wintered in cold frames, should be transferred to beds or borders; if in beds, plant them about 15 inches apart each way. Hyacinths should be kept tied, and protected, as previously advised, with other tender spring flowers.

Half-hardy Annuals should have plenty of air afforded them in favourable weather, so as to render them sturdy; and, when sufficiently advanced, they should be pricked off into pans or boxes, or in hand-lights or cold frames, protecting them from cold winds and frost, and hardening them off well as growth advances. Sowings of all kinds of plants required for the flower garden this season, should be done at once. There is still plenty of time, but delay will shorten the period of flowering. *D. C. Powell, Powderham, Devon.*

THE ORCHID HOUSES.

THE COOL HOUSES.—Closely examine the plants for aphid and slug, and lay pieces of Potato upon the pots for catching the latter, also bran on pieces of slate, examining these baits once or twice in the evening; aphids may be entirely kept under by the use of the syringe. This should be done with the nozzle, or single jet, over which the fore-finger should be held firmly when employing it. Some growers fumigate with tobacco, but to the use of this I have objections, for I have seen some of the best houses full of *Osontoglossum* reduced to a pitiable condition by its use. *Disa grandiflora* and its varieties are very apt to get aphid in the young growths, but this may be easily killed by the use of a camel-hair brush and some soft soapy water. Keep the stages and walls thoroughly moist, and the night temperature about 50°, rather under than over.

East Indian House.—*Cattleya Dowiana* and *auracea* are now pushing growth, and if re-potting or surfaceing is required by the plants, it should be now done; these species enjoy a good heat, and much moisture. *Cattleya Elfordiae* and *C. superba* will be found to do well in this house. *Cypripedium Godfreyi* and *C. bellatulum* should still be kept on the dry side, they being species very apt to damp off at the base.

Dendrobium Cambridgeanum should be re-blocked or re-basketed. This is an Orchid which does not like a large amount of peat and sphagnum moss about its roots, but fixed to a block of Apple or Pear wood, with a small quantity of sphagnum, it does very well indeed. Water them abundantly, and dip them in the morning and afternoon of fine days. *D. noble* and *D. heterocarpum*, for early flowering, should be making strong growth, and be kept at the warmest part of the house, and where a very humid moisture is maintained.

Plants of *Cattleya gigas* newly imported will be best hung up by the roots, and a thick shading placed over them for a few days, they being not then so likely to lose their leaves. The temperature of this house should be that advised in my last Calendar. *A. G. Cull, Parkfield, Worcester.*

FRUITS UNDER GLASS.

VINES.—The simplest plan to put a fresh kind on an old Vine is to strike well-ripened eyes in bottom-heat, and inarch the growing canes on to the young wood of the old Vine, although bottle-grafting may be recommended in some cases. The *Guava* ripens its fruit and does well on the back wall of a vinery if not too densely shaded, and forms a handsome evergreen covering to the walls.

Melon-house.—Plants whose stems were stopped in order to produce fruiting laterals, may have the laterals stopped at the first joint beyond the fruit; aim at getting three or four flowers open on the same day, impregnating the flowers daily until a good set is obtained. Remove and pinch out all useless shoots, and be careful not to over-water, especially during flowering. Renovate the fermenting material from time to time, if it be getting too low, and maintain brisk heat. Plant out successional crops; also sow more seeds, and prepare dungbed frames.

Cucumber-house.—Winter plants which are still clean and fruiting well will require abundance of manure-water, and top-dressings of turfy loam and

spent Mushroom-bed dung. Guard against over-cropping, cut the fruit whilst young, and train in healthy young shoots. Maintain a high atmosphere, with much moisture, and damp down occasionally with strong dung-water. For several years at Blenheim, Cucumber disease baffled all my efforts at curing it, and the only course was to burn all the infected plants and start afresh, avoiding the use of fermenting materials for a time. Spring raised plants should be planted 6 feet apart, stopped as soon as half-a-dozen leaves are made above the trellis, the laterals being trained out thinly—severe prunings being guarded against. Cucumbers are good feeders, and require but a small amount of ventilation, and a temperature of 70° at night, 80° by day, and bottom-heat 70° to 80°.

Strawberry-houses.—Introduce plants in weekly batches. President will now make a good succession to *La Grosse Sucrée*, but it takes a little longer to perfect its fruit. The Strawberry-house may be kept cooler at one end to receive successions from the frames, and which, as they progress, should be moved onwards till they finish on an airy warm shelf for bringing up the flavour (we always winter our plants in coal ashes on floors). Temperature, night 50° at the cool end and 55° at the warmer end. Give liquid manure to plants swelling their fruits. My opinion of *Noble* is favourable as a second crop, but the fruit ripens at the point first. The fruit is noble in appearance, but not equal to *La Grosse Sucrée* as a first early fruit in houses.

Tonatos.—Plants raised from cuttings in August last will now, with the help of the camel-hair brush, be again flowering and setting. I prefer to have them in 12-inch pots. Stop the laterals above each bunch of flowers, unless there is space on the trellis on which to train the shoots. As soon as their crop of fruit is set give manure-water, sow seeds and prepare plants for future planting. If white fly attacks the plants, there is no better antidote than Calvert's soft-sap, dissolving 1 oz. in 1 gallon of soft-water, and frequently syringing the plants with it.

Orchard-house.—Give sufficient fire-heat to raise the temperature, and maintain a brisk circulation of air, the more so if the trees are nearly in flower, the flowers of *Plums*, *Pears*, *Cherries* being liable to suffer from must air. Trees in pots must never feel the want of water; it is very important that they should be well watered previous to their flowering, in order to carry them over that period. Fumigate the house before the flowers expand.

Peaches and Nectarines. Continue to disbud and thin the fruit, and bring the shoots to 6 inches apart at the base, and the fruit to an average of one to each square foot, giving preference to those that face the sun. The trees in the earliest house will now be stoning, and a regular temperature must be maintained.

Figs may be thinned finally, an operation very often not required. Syringe twice daily, and water with manure or give mulchings. Keep every department rigorously clean. *H. C. Cull, Madresfield Court, Malvern.*

THE HARDY FRUIT GARDEN.

PEACHES AND NECTARINES. The training of these trees should be completed early, the favourable change in the weather having caused the flower-buds to swell. Young *Plums*, *Apricots*, and *Peaches*, that have not previously been well-trained, should be partially disbudded as soon as they have started fairly into growth, all straight shoots being rubbed off first, leaving such only as are likely to lay close to the wall; and any strong ones which seem likely to unduly take the lead must have the points pinched out. A similar process of pinching strong shoots is necessary with older vigorous trees, in order to furnish them with bearing-wood. However clean the trees may have been last year, and well washed this winter, aphids will always appear just before the flowers open; closely examine the shoots, therefore, and dust them with tobacco-powder if aphids be noticed on them.

Figs.—These fruit trees in warm districts should have the branches thinned out, so as to make room for laying in new ones, the production of which may be encouraged by a good thinning-out of the older main branches. If summer pinching and thinning were attended to, very little will remain to be done to Figs at this season. The terminal bud of every

shoot should be pinched out, to encourage a greater number of embryo Figs to grow. In cold districts, where covering the Figs is adopted, the protecting material should be removed by degrees, our springs being very treacherous, one day being like summer, and the next like winter, and these sudden checks are injurious. Trees not in a satisfactory bearing condition should be attended to within the next three weeks. The chief aim should be to keep the roots near to the surface, for if these are allowed to get into a cold inert subsoil, the crop of fruit is always a thin one, no matter how well the tree should look aboveground. This arises simply from the wood not getting ripe. To remedy this state of things, dig a deep trench along the front of the border, dig under the roots, and lift them out by working with a fork towards the wall. Having laid the roots bare, shorten them a little, and add some fresh loam and mortar rubble to the border, trenching it over. Then spread the roots out, and cover them with about 6 inches of turfy loam, with a liberal quantity of mortar rubble. Mulch with 2 inches of old manure, which will not cause gross soft wood as when it is buried about the roots. If Figs are trained horizontally, it will be found to check their often too luxuriant growth, and assist the ripening of the young shoots.

Grafting of Apples and Pears.—This operation should always be finished before the trees begin to grow, the most forward varieties being grafted first. Double grafting of unsatisfactory kinds will often improve them; but I have noticed that when vigorous root stocks are used for delicate varieties, a vigorous crop of root-suckers follows grafting. I am of opinion that root grafting will be more generally adopted than at present, as inducing precocity for the first year or two, and eventually allowing the tree to become established on its own roots. *A. E. Ans, Lytle Hill, Halesowen.*

THE KITCHEN GARDEN.

The weather during the past week was all that could be desired by the kitchen gardener for the sowing of the main crops of Onions, Parsnips, early Carrots and the planting of some early Potatoes. In addition to the above, sowings of Brussels Sprouts, Cauliflowers, Leeks, Lettuces, and Radishes were made, also plantations of *Seakale*, *Globe Artichokes* should now be partly relieved of their winter protection, and if new beds are to be made, the ground should be thoroughly prepared by the first week of April, trenching and manuring the land heavily with decayed farmyard dung. If large heads are looked for, plant sturdy suckers in groups of three when of about 8 inches high, pulling them up from the old stools. These groups of suckers should be not less than 4 feet apart, and in the rows 5 feet. If the soil is shallow and open, it is best to remove 8 inches of the top soil, and plant firmly, afterwards filling in the hollows with manure; and if the soil be dry, watering the plants before putting on the mulching. If required, these plants will produce nice heads late in the first season, after planting making a succession to those from old stools. Thin out weak stools from among the old stools.

Asparagus.—Place more of these into gentle heat. From now onwards, very little bottom heat will be required. Keep the frames, &c., close till the grass appears, doing the forcing with as much sun heat as possible; slightly damp over at midday with tepid water, and cover up the frames early in the afternoon.

Celery. Now is a good time to sow the main crop of Celery, sowing the seeds in pans, placed in a vinery, just started, or under hand-glasses, at the foot of a south wall. Bring the pans out of the vinery when the plants are up, and place them in a cold frame, and those in hand-glasses must be ventilated daily—there must be no cobbling. A second sowing may be made about the middle of the month of April. It is questionable if there is a better Celery than Major Clark's Red, Matchless and Winchester Reds are also varieties we are growing at this season; and Sandringham White and Veitch's Superb for early use.

Cauliflower plants may now be transplanted from frames with a trowel, planting them between rows of Peas, and protecting with Spruce boughs. Those raised under glass in heat are safer when planted in the second or third week in April. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

NEWSPAPERS. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, MAR. 25. } Royal Horticultural Society at Westminster; Fruit, Floral, and Scientific Committees, and Lecture by M. H. de Vilmorin.

SHOWS.

WEDNESDAY, MAR. 26. } Royal Botanic Society, at Glasgow and West of Scotland.

THURSDAY, MAR. 27. } Shropshire (at Shrewsbury).

FRIDAY, MAR. 28. — Falkirk.

SATURDAY, MAR. 29. — Crystal Palace.

SALES.

MONDAY, MAR. 24. } Lilies and Greenhouse Plants, at Protheroe & Morris' Rooms.

WEDNESDAY, MAR. 26. } Roses, Fruit Trees, Shrubs, Border Plants, and Bulbs, at Stevens' Rooms.

THURSDAY, MAR. 27. } Lilies, Palms, Rose Trees, &c., at Protheroe & Morris' Rooms.

FRIDAY, MAR. 28. } Orchids in Flower and Bud, and Lilies from Japan, at Stevens' Rooms.

THURSDAY, MAR. 27. } Greenhouse Plants and Rose Trees, at the City Auction Rooms, by Protheroe & Morris.

FRIDAY, MAR. 28. } Clearance of Nursery Stock, at the Royal Nursery, Ascot, by Protheroe & Morris.

FRIDAY, MAR. 28. } Established and Imported Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—44.2.

The Bull Mite on Eucharis. OUR correspondence on this important subject is so very extensive that, without excluding much other matter of interest, it would be hardly possible to find space for it in our columns; nor does it appear on perusal to contain any statements regarding culture, soil, temperature, and management generally, which have not been stated many times previously in our columns. We take a few—"S. W." tried petroleum and water, at a temperature of 135°; pure petroleum, slaked lime, afterwards plunging the potted bulbs in brisk bottom-heat. These very drastic measures killed some, and others recovered—the writer believing that these were but little affected. He attributes the presence of the mite to be due to overwatering; but does not say how water is able to bring about the birth of an insect, although external causes, as we know, do facilitate attacks of a fungoid nature; but that is something quite different. Mr. JOHN HEARNS does not believe in the burn and destroy dictum, and says that unhealthy Eucharis are always infested with mite, and when very much so the bulbs cannot be freed from them; but "if taken in time"—that is, when there are but a few mites, the plants recover. He does not tell us what is the remedy, and he knows of no plant which will so long put up

with bad cultivation, and yet give fair returns. "R. M.," in an interesting letter on Eucharis-growing as practised by himself, and which will be found at p. 365, is not a believer in curing "mite," and advises the destruction of infested bulbs, giving the unsuccessful treatment of Eucharis bulbs by a clever gardener in his neighbourhood, and the non-success of others, as the cause of his want of faith in all remedies hitherto employed. The lessons taught by these and other communications we have received are, that high temperature and plenty of water when growing, are needed, but less water when it is desirable that the plants should be rested, which should not be oftener than twice in a year. To dry off a river side plant of the tropical region of Brazil is contrary to its nature, although there will occur times when the rivers are low—that is in late summer—when the soil of the banks is less moist than is the case in winter, spring, and early summer. The plant flowers in flood time, which corresponds with its season of growth, and which is the period also at which the plant demands of the gardener the fullest supplies of water, and, when crowded in pots, of weak stimulants. Departures widely made from its natural conditions, and persisted in for several years, doubtless tend to debilitate the plant, and render it susceptible to the attacks of an insect not peculiar to Eucharis, but which infests other bulbs, just in the same manner that thrips and red-spider will attack weakly plants of other species, and get the mastery of them when left unchecked.

It must be remembered that the mite is not the only agency at work, for fungus also plays a part in so far as regards the bulbs of Eucharis, and the difficulty in detecting the pest without the aid of a lens adds further perplexity to the matter. The gardener who does not see the creature that is working so much mischief amongst his plants is loth to take radical measures for its extinction, and yet it is the only course which is left to him when the ravages, which might have been stayed by earlier remedial measures, have become deep seated. It has come to our knowledge—quite recently—that a cultivator well versed in the management of bulbs, especially Hippastrums, has been able, by very simple means, to cure bulbs of this species, when attacked by the mite, and we quite think that his methods are likely to prove efficacious when the mite has not penetrated beyond the outer envelope of the bulb. The bulbs are shaken out of the soil, washed in warm water, in which some Chelsea Blight Composition is mixed, and afterwards dried thoroughly. The process of drying may take some weeks. The bulbs are then potted in moderately rich loamy soil, the pots used being only just sufficiently large to admit the bulb. The after-treatment of these hitherto infested bulbs was that pursued with healthy bulbs, and in no case has there been any re-appearance of the mite.

Those who wish to know what the mite is like, may consult the figures (fig. 51, p. 324), which were placed at our disposal by Mr. MICHAEL, the learned expositor of the forms and life-habits of these mischievous pests.

A CARPET BED IN THE JEPHSON GARDENS, LEAMINGTON.—The public gardens of the town of Leamington, Warwickshire, called after their donor, the late Dr. JEPHSON, have been greatly improved at various times, and are exceedingly well kept at all times, and particularly gay in the summer and early autumn months. The following description of the bed shown in fig. 53 is from the *Leamington Advertiser*, and is part of a general account of the gardens:—"The carpet and other bedding is this year, 1889,

a special feature, and reflects the highest credit upon Mr. LONGROD, the head gardener, by whom they have been so skilfully arranged. In the present article we shall confine ourselves to the carpet bedding and other special designs, which are now in their full summer beauty. First, perhaps—although of course this is a matter of taste—is the largest specimen—and a very fine specimen it is—of carpet bedding near the monument which contains the marble bust of the late Dr. JEPHSON. The bed measures 23 feet in its long diameter, and is a magnificent specimen of artistic combination of colour. It contains about 10,000 plants, every one of which appears to occupy the individual position which it was predestined to take. The design is a series of scrolls representing a pair of Eolian harps. It has a raised centre, in which is a very fine specimen plant of the *Dracena australis*, which is surrounded by a hundred plants of the *Echeveria Peacockii*. The groundwork is composed of the pretty *Herniaria glabra*, with a belt of *Mentha pulegium gibraltarium*, dotted with a *Pachyphytum bracteosum* at regular intervals. The scrolls are outlined with *Echeveria secunda glauca*, and the colouring is obtained by three forms of *Alternanthera amara*, *versicolor*, and *paronychioides aurea*. The scrolls are filled in with *Leucophyton Brownii*. The bed is raised about eight inches from the level of the lawn, and is bordered by a double row of *Echeveria secunda glauca*. A number of plants, which stand higher than the average bedding, are used as "dot" plants, and these give a grace and finish to a piece of work which for taste and arrangement, could not well be surpassed. The beautiful *Pyrethrum arnum selaginoides*, which does not run to bloom, has been introduced in sufficient quantity to give an effective colouring to the whole."

HORTICULTURAL CLUB.—This Club, held at the Hotel "Windsor," Victoria Street, Westminster, was established to provide a meeting-place for all classes interested in horticulture, for social gatherings from time to time, for the monthly meetings, when papers are read on horticultural subjects, and to afford its members all the advantages of a first-class club on moderate terms. The reading-room is supplied with all the gardening periodicals. The vicinity of the Club to the meeting-place of the Royal Horticultural Society, makes it very convenient for persons attending the Society's meetings. It has also afforded a home for the following Societies:—The National Rose Society, the National Carnation and Picotee Society, the National Auricular Society, the National Dahlia Society, and the British Fruit Growers' Association. A special dinner of the Club will take place on Tuesday next, the 25th inst., at 6 p.m. MRS. HENRY DE VILMORIN will be the guest of the Club.—The usual monthly dinner and conversation took place on Tuesday evening, Dr. HOSE, in the absence of Mr. JOHN LEE, presided; there were present besides: the Rev. W. WILKS, Rev. F. H. GALL, C. T. DRURY, Messrs. Girdlestone, J. H. VEITCH, A. VEITCH, G. BUNYARD, H. J. PEARSON, C. E. PEARSON, T. FRANCIS RIVERS, &c. The subject for discussion was "Plant Hybridism," which was opened by a very thoughtful and interesting paper by Mr. Lewis Castle, owing to whose unavoidable absence it was read by Mr. Geo. Bunyard. Mr. Veitch dealt with the subject in relation to Orchids; Mr. Drury, to Ferns; Mr. Pearson, to Pelargoniums; Mr. T. Francis Rivers, to fruit; while most of the members present joined in the discussion.

GARDENERS' ORPHAN FUND.—A meeting took place at the Mummams Hotel, Covent Garden Market, on Friday evening, the 14th inst., at 9 p.m., convened by the Committee of the Gardeners' Orphan Fund, and at which a goodly number of standholders in the Flower Market were present, the immediate object of the meeting being to carry out a third Floral *Fête* in aid of the Fund during the month of May. Mr. GEORGE DEAL presided, and among the growers present were Messrs. G. Messer, G. Poulton, E. Sawyer, H. Hawkins, S. Pimley,

Jan., G. May, G. Wermig, J. Lewington, W. G. Williams, W. Gregory, J. Walton, H. R. Wright, J. W. Baker, J. Bannister, A. Cattaneo, &c., the Committee of the Fund being also well represented. The Chairman having opened the proceedings by reading a letter from Mr. J. BOURNE, conveying the willingness of the Duke of Bedford to grant the use of the market for the purpose; and one from Mr. W. J. SOULSBY, Secretary to the Lord Mayor at the Mansion House, stating that the Lord Mayor and Lady MAYNESS will be happy to become the Patrons of the *Fête*, and will, if possible, attend the same. It was, therefore, moved by the

Walton. The best date for holding the *Fête* was discussed, and ultimately it was decided by the meeting that it take place on Wednesday, May 21, though some of the standholders thought a later date would be more suitable. The joint committee will meet at the Caledonian Hotel on Friday evening, the 28th inst. — On Friday evening, March 14, a lecture on "Apples, their Culture and Use," was delivered by Mr. W. ROSELL at the British Workman's Club, Upper Tulse Hill. Mr. T. BUXTON MORRIS presided, and opened the proceedings by explaining that the lecture was given on behalf of the Gardeners' Orphan Fund, which

the day on which the exhibition of Tea Roses will be held at the Drill Hall; the dinner will take place at the Hotel Windsor at 6 o'clock, and the Chair will be taken by the Very Rev. the Dean of Rochester, President of the Society.

HALL FOR HORTICULTURE.—We learn that at a meeting of the "Sites Committee," held on Monday last, it was resolved to call a great meeting (of which due notice will be given) of horticulturists and the horticultural trades throughout the kingdom, when the whole scheme and present position of affairs will be fully explained. The committee hope

FIG. 553.—A CARPET BED IN THE JELFES GARDENS, LEAMINGTON. (SEE P. 359.)

chairman, seconded by Mr. J. WALTON, and carried unanimously, "That this meeting cordially endorses the proposal to hold a third evening *Floral Fête* in aid of the Gardeners' Orphan Fund; and, having heard with pleasure that His Grace the Duke of Bedford has kindly granted the use of the Flower Market for this purpose, this meeting pledges itself to render the best assistance in its power to carry out the same, and to co-operate in general with the committee of the Fund." On the motion of Mr. W. GREGORY, seconded by Mr. J. WALTON, the following standholders were appointed a committee of sixteen to co-operate in carrying out the *Fête*.—Messrs. W. Baker, G. May, G. Messer, J. Bannister, G. Poulton, J. Lewington, H. B. Bay, E. Sawyer, T. A. Dickson, A. Cattaneo, E. Rochford, A. Bullen, G. Wermig, Jas. Williams, W. Gregory, and J.

institution he commended to the meeting in a forcible address. The lecture was of a comprehensive character, and conveyed much practical information concerning Apples, and the best methods of culture. Quotations from various authors were given, and some extracts from Mr. R. D. BLACKMORE'S recent work, *Kit and Kitty*, were well received. A collection of well-preserved Apples was staged, and during a pause in the lecture some baskets of fruit were handed round for the audience, to enable them to taste. A substantial collection was made, and several new subscribers to the Fund gave in their names.

NATIONAL ROSE SOCIETY.—We understand that it has been determined by the Committee to alter the date of the Annual Dinner to June 21,

that the trade, upon whose attitude much depends, will see that it is to their interest to popularise horticulture, and take the matter up with spirit, and that a large number of gentlemen, commercially interested in horticulture, both in London and the provinces, will attend, as the scheme will benefit the latter nearly, if not quite as much as the former.

"ICONES PLANTARUM."—The last part just issued contains twenty-four uncoloured lithographic illustrations of various species of *Stapelia*, with descriptive text by Mr. N. E. BROWN. This botanist is known to have studied this remarkable group for some years; he has grown many of them, and taken every opportunity of studying the living plants as well as those preserved in the herbarium. It is to be hoped that we may have ultimately a complete mono-

graph from the hands of this conscientious and painstaking botanist. In the meantime Mr. Brown has dealt with the large mass of material of all kinds collected by Sir HENRY BARKLY, formerly Governor of the Cape of Good Hope. Thirteen genera and a large number of species are thus systematically catalogued, the list being preceded by some valuable notes on the morphology of the group, and on the characters by which the genera and species may be distinguished. The range of variation is shown to be very large—so much so, that two distinct genera might be made out of one species, were its history not known. The characters "blend and intermingle in a manner that in many cases defies classification." The botanists can hardly complain of the gardeners in this case, for the blending has been done, not by them, but by insects. Mr. Brown notes the rapidity with which the seeds germinate under suitable conditions, which would seem to denote an adaptation to the climatal circumstances under which the plants grow naturally.

"KEW BULLETIN."—The March number contains articles on "Indian Yellow," a dyeing material prepared from the urine of cows fed upon Mango leaves; also on Bombay Aloe fibre procured from *Agave vivipara*, the cultivation of which in waste land near Bombay, for the sake of its fibre, is strongly recommended. Barilla manufacture in Egypt is the subject of another article, the barilla being carbonate of soda, contained in the ashes of certain seaside and salt-lake plants like our *Salicornia*.

RICHMOND SHOW.—The Spring Show of the Richmond (Surrey) Horticultural Society was held in the Gymnasium of the Castle Rooms, on March 18 and 19, when a pretty, although small, display was made. The chief prizes for bulbous plants, Lily of the Valley, and *Spiraea*, were awarded to Messrs. H. WILLIAMS & SONS, Fortis Green, Finchley, who showed in their usual style. From the gardens of H. LITTLE, Esq., The Barons, Twickenham, came several good lots of plants, and this exhibitor was first for *Cliveas* (which were very fine) and *Doutzia gracilis*. He also had the best six Orchids, with a nice piece of *Cymbidium Lowianum*, and won the first place for a group of plants arranged for effect, having several Orchids. Mr. D. WHITE, gardener to Mrs. WATSON, Isleworth, who was another successful exhibitor, had a well-flowered specimen of *Azalea indica* in the variety *Dac de Nassau*, and was also first for *Cyclamens*. *Azalea mollis* were also good, Mr. BROWN, of Richmond, having a finely flowered collection. Cottagers' exhibits were well represented, and were fairly numerous. Apples, in well kept examples, were shown by Mr. BATES, gardener to E. S. NICHOLSON, Esq., Poulett Lodge, Twickenham; and Mr. J. WALKER, Ham Common, sent a comprehensive collection of *Daffodils*, the effect of which was destroyed by the white cloth with which all the tables were covered.

ORCHID NOMENCLATURE.—It is greatly to be regretted that a series of suggestions printed for the use of the committee appointed by the Royal Horticultural Society to consider the matter, and marked "Private, proof under consideration," should have been published in its entirety in the *Orchidophile*. We can only suppose that the Editor overlooked the word "Private," or was imperfectly acquainted with the English language and the etiquette of committees. As a matter of fact, the document differs greatly from that which will shortly be issued by the Society as its final recommendations.

SHOW FIXTURES.—We have received the schedule of the Shropshire Horticultural Society, which announces shows at Shrewsbury for March 27, August 20 and 21, and November 20. The accompanying balance-sheet shows the satisfactory clear profit of £226 on the year's working. Sums of £25, £20, and £15 are offered for twenty stove and greenhouse plants at the summer show. Various other valuable prizes are also included. The Sherborne Horticultural Society's annual show will take place

on August 27, and the Scottish Primula and Auricula Society will hold its fourth exhibition on May 8, in the City Assembly Rooms, Dundee.

NEW JERSEY AGRICULTURAL STATION.—The last issued *Bulletin* deals with two fungous diseases which infect the Cranberry, one produces minute red galls, and hence is known as the Cranberry Gall fungus, *Syntrichium Vaccinii*; the other is the Cranberry Scald, which is also due to the attacks of a minute fungus, and is so destructive as to cost the loss of a third of the crop. Mr. HALSTED gives an account of the life habits of these fungi, so far as they are known.

PÆONIES.—We are requested to state that the Curator of the Cambridge Botanic Garden, in view of a paper to be read before the Royal Horticultural Society, is anxious to know of all the kinds of Pæony, not of garden origin, that may now be in cultivation, and also to be made aware of all the botanical names that are now in use. Mr. LYSCU would be greatly obliged for information of any kind on the subject.

PRIMULAS.—Messrs. JAS. CARBER & CO., High Holborn, London, have submitted to our inspection a collection of blooms of their strain of Chinese Primulas. The flowers are well-formed, of large size, and there are some good colours especially among the Magentas and Carmines. Singles and doubles are equally pleasing.

THE GRAPES OF ESCHOL.—A correspondent kindly calls attention to an error at p. 287, in which the famous bunch is said to have been brought to Moses when the Israelites were "near the close of their wanderings." Perhaps the statement is "too absolute." It may be well to cite the passage from Numbers, xiii., 24, 25:—"Then they came to the river of Eschol, and cut down thence a branch with one cluster of Grapes, and they bare it upon a barre between two, and brought of the Pomegranates and of the Figs. That place was called the River Eschol, because of the cluster of Grapes which the children of Israel cut downe there." We are quoting from the edition "imprinted at London by ROBERT BARKER," in 1615.

FLOWERS IN SEASON.—Some excellent blooms of *Primula sinensis* have been sent to us by Messrs. B. S. WILLIAMS & SONS, Paradise and Victoria Nurseries, Upper Holloway. The colours decided and good, and the blooms regular of outline, and showing much substance. The *Primulas* of this nursery firm have long enjoyed a good reputation—the reward of years of careful selection and crossing.

BIOGEOGRAPHICAL INDEX OF BRITISH AND IRISH BOTANISTS, from the *Journal of Botany* (continued from p. 293):—

"MURDO, WILLIAM (1830—1879): b. Bedale, Yorkshire, 1830; d. Cambridge, 1879. A.L.S., 1868, Curator, Cambridge Bot. Gard., 1850?—1879. "Manual of Brit. Lichens," 1861, and 3 fasciculi of 100 specimens each. Pritz., 225; Jacks., 245; R. S. C., iv., 502; Gard. Chron., 1879, 558; Journ. Bot., 1879, 169; Trans. Bot. Soc. Edin. xiv., 49.

"MUNRO, WILLIAM (c. 1816—1880): b. Druidstoke, Gloucestersh., circ., 1816; d. Montys Court, Taunton, Jan. 29, 1880. General, 33rd Regiment, C.B. F.L.S., 1840. Collected in Madras, Bengal, and Himalaya. "Bambuseæ," Linn. Trans., 1850; "Timber Trees of Bengal," 1847; "Himalayan Primroses," Garden, 1879. Herbarium and MSS. at Kew. Pritz., 228; Jacks., 431; R. S. C., iv., 543; viii., 471; Journ. Bot., 1880, 96; Gard. Chron., 1880, xiii., 169; Trans. Bot. Soc. Edin., xiv., 158. *Monroa Torr*, *Monroa* Wight.

"MURPHY, EDMUND (d. 1828—1844). Landscape Gardener. Of Dublin. "Contributions to Fl. Hibernicæ," Mag. Nat. Hist., 1828, 426; "Agricultural Grasses," 1844; *Hortus siccus* illustrating same. Pritz., 228; Jacks., 196; R. S. C., iv., 551.

"MURRAY, ANDREW (b. before 1810; d. 1850): d. Cambridge, July 4, 1850. Curator, Cambridge, Bot.

Gard., 1845—1850. "Catalogue;" Sir Walter Scott, Journal, 1826; Gard. Chron., 1845, 291; 1850, 438.

"MURRAY, ANDREW (1812—1878): b. Edinburgh, 1812; d. Kensington, January, 1878. W.S. F.L.S., 1861. Pres. Bot. Soc. Edinburgh, 1858. Assistant-Secretary, Roy. Hort. Soc., 1860. "Pines and Firs of Japan," 1853; Lawson's "Pinetum," Pritz., 228; Jacks., 586; R. S. C., iv., 555; viii., 475; Trans. Bot. Soc. Edin., xiii., 339; Gard. Chron., 1878, i., 86; Eat. Mo. Mag., xiv., 215; Journ. Bot., 1878, 63.

"MURRAY, LADY CHARLOTTE (d. 1808). Of Athol House, Scotland. "The British Garden," 1799; ed. 3, 1808; Eng. Bot., t. 404; Jacks., 497.

"MURRAY, PATRICK (d. 1680). Baron of Livingston, Pupil of Andrew Balfour. Collected 1000 plants at Livingston before 1680, the nucleus of Edinb. Bot. Gard. London, Encyc. Gardening, 281. *Livistona*,

A CHAT ABOUT FERNS.

We take the following extracts from an interesting paper read by Mr. W. B. Latham, the Curator of the Birmingham Botanical Gardens, at a meeting of the Birmingham Gardeners' Association.

In allusion to the early history of Ferns, Mr. Latham quoted from our old gardening writers, amongst others, Philip Miller, who, in his *Gardeners' Dictionary*, published in 1763, in speaking of the common Polypodium, says, "There are several other species of this plant which are natives of America, some of which are preserved in curious Botanic Gardens variety, but as they are rarely cultivated in other gardens, it is not worth while to enumerate them in this place." Parkinson makes no mention of Ferns in his *Paradisus Terrestis*, published in 1629, but in his work *Parkinson's Herbal*, or "Theatre of Plants," published in 1640, is referred to by James Bolton, of Halifax, who published a descriptive illustrated work on British Ferns in 1785, so that we may suppose that in his *Herbal*, Parkinson had something to say about Ferns. Dr. Gustav Kunze, a German botanist, published in 1837, a descriptive work on Ferns, in which about thirty-seven species of exotic Ferns are beautifully illustrated, giving detailed drawings of the fronds and fructification, showing the sporangia, spores, indusium and scales. In another work by the same author, commenced in 1848, and continued in parts for a few years, are coloured plates giving illustrated details as complete as in the former work, and (Mr. Latham goes on to say), "I know of no work on Ferns where the illustrations are given in the superb style these are." More recent writers on Ferns were mentioned, especially the late Mr. John Smith, the first Curator of the Royal Gardens at Kew, who for upwards of forty years made Ferns a special study, under conditions so much more favourable than it is possible for a botanist, with only herbarium specimens before him. Mr. Smith had under his charge one of the best, if not the very best collection of living Ferns ever got together, and to a great extent, by his own exertions. His knowledge of Ferns was marvellous, and a favourite study with him, and he gave us two most useful books—one, *Ferns, British and Foreign*, published in 1865, a most complete list of Ferns to that date, useful to the student and cultivator of these plants. In 1875, was published his *History of Ferns*, a book teeming with information, and one no student of Ferns should be without, as showing the rapid increase in the number of species of Ferns under cultivation during the present century. The following quotations is from Smith's *History of Ferns*, 1875.

"The total number of garden Ferns introduced previous to 1813 was eighty-three (this does not include British Ferns), and the entire collection of exotic Ferns at Kew at that period was not more than forty species. In 1846 there were 348 species in the Kew Gardens, and in 1857, 600 species were known in British gardens. In *Ferns, British and Foreign*, 1886, 164 genera are described, and 1028 species are enumerated." Mr. Latham further observed that at this period—say from 1840 on-

ward—great attention was paid to Ferns, both by the botanist and horticulturist, and if a complete list of cultivated Ferns could now be taken, we should have great difficulty in finding the same number of species in cultivation as was recorded some twenty and more years ago. One other name must be mentioned, that of the late Mr. Thomas Moore, who did so much for our knowledge of Ferns, by determining new species and varieties. Mr. Latham, in his paper, treated of the formation of spores and their treatment for propagating purposes from the prothallus stage onwards, and stated that the first Fern known to have been raised from the spore in this country was at the Oxford Botanic Gardens in 1715, and commented on the length of time a Fern spore will retain its vitality under favourable conditions. Mr. Latham remarked, "I have raised Ferns from spores that have been in my possession for seven or eight years, and these have germinated and grown freely. One would hardly expect that this atom of life would grow after being kept in paper so long."

The spore of a Fern differs from the seed of a flowering plant, inasmuch as it is an unfertilised body containing no embryo, and incapable of reproducing itself further than the prothallus state [except by buds. Ed.] until fertilisation takes place, and it will remain sometimes in this condition for months, and even years, but a prothallus (the first stage of vegetation from a spore) will die ultimately unless it possesses two minute organs underneath, the antheridia and the archegonia. These male and female bodies are quite microscopic, and are to be found on the underneath side of the prothallus. The antheridia give off spermatozooids, which move about until they come into contact with and pierce the cells of the archegonia. Shortly after this contact takes place, a little growth will appear, and a little later, on close observation, a small front may be seen pushing forth, and one after the other will follow until the plant under favourable conditions is fully developed. These organs of reproduction in Ferns were not known until Count Suminski, a Polish botanist, made the discovery in 1848.

NOTICES OF BOOKS.

FALLOW AND FODDER CROPS. By John Wrightson. (Chapman & Hall.)

A treatise by one who is not only a master of his subject practically, but is one, from the circumstances of his position, has special opportunities of knowing what are the requirements of the farmer and how best to meet them, needs only to be mentioned to command attention. Here we can do but little beyond pointing out the subjects with which Mr. Wrightson deals—these are bare fallows, root-crop fallows, Turnips, Mangel Wurzel, and other roots, Rape, Kohl rabi, catch crops, summer fodder crops, Clovers and Seeds, and Ensilage. Bare-fallows do not commend themselves now-a-days to the gardener, but, he like the farmer, only has recourse to them when circumstances do not permit of any other course. In the great Rye-grass question, Mr. Wrightson sides with his colleague, Dr. Frean, and indeed the evidence seems to preponderate in favour of this unjustly maligned grass.

SCIENCE AND SCIENTISTS; some papers on Natural History. By Rev. John Gerard, S.J. (London, 18, West Square.)

A series of papers pungently written, and directed against that unscientific use of the imagination which is frequent now-a-days, and which will remain so as long as people prefer picturesque declamation and sensational statements to rigid investigation and accurate deduction. Mr. Grant Allen is one of the greatest sinners in this direction, and to him Father Gerard devotes much attention and not without

reason, for while botanists can distinguish between what is true and what is the product of Mr. Allen's feigned imagination, the general reader is likely to gulp it all down, fact and fiction, as unassailable dogma. The more or less plausible hypotheses in which writers of facile pens indulge, have their value as hypotheses, but they should not be considered as demonstrated facts, but only as fragments around which may crystallise and become co-ordinated facts, which otherwise would be isolated and devoid of significance. Some disciples have broken away from the method of Darwin. Patient exploration and careful probing, assiduous accumulation of evidence, were the means he employed before he committed himself to any statement, and no one was more careful to keep apart what he knew and what he conjectured.

HOW TO KNOW GRASSES BY THE LEAVES.

By A. N. M'Alpine. (Edinburgh: David Douglas.)

This is a little treatise which we should strongly recommend to be used in schools in agricultural districts. When once the tutor had mastered its contents, which, with the grasses before him, he could easily do, he might demonstrate to his pupils, and make them find out for themselves the characters and distinguishing marks of the several grasses of our pasture land. Mr. M'Alpine relies largely on the colour of the leaf-sheaths, but does not neglect the more important points connected with the distribution of the nerves, the hairs, ligules, &c. Mr. M'Alpine has produced a very useful little book, which is recommended, moreover, by Professor Wallace, the Professor of Agriculture in Edinburgh University, in a highly eulogistic preface.

FOREIGN CORRESPONDENCE.

BERLIN LETTER.

SPRING has been with us since March 13; that day was, indeed, the first warm one. It is interesting to see how rapidly vegetation commences when the minimum of temperature necessary for the development of plants, though it is different in the different species, is surpassed. On the morning of March 13 all was in winter-sleep; at 3 o'clock in the afternoon many of the Crocuses, Galanthuses, Leucojums, and Scillas were in full flower. This reminded me of the rapid development of plants in spring at St. Petersburg, where at the commencement of the week all is in repose, but at the end of the same week in full growth.

Horticulture may take a lesson from botany. Horticulture has been an empirical art up to this day, because horticulturists do not take notice of the results of the studies of botanists, or, rather, because botanists do not communicate their results to horticulturists. It is well known to botanists, as well as to horticulturists, that each plant needs for its growth a minimum of warmth, as also that there exists both a maximum and an optimum of warmth for growth. Well, the general fact is known to both—to the theoretical man as well as to the practical one. The investigations of the former tell us what are the boundaries for a great many plants, or, at least, the lowest limit, as the upper extreme is never or seldom reached in our climate.

Another example. The anatomical structure of leaf is adapted to the climate. Plants, which grow in an air saturated with moisture and of high temperature, show quite another structure as compared with those growing in a hot, dry climate. The anatomical structure is known to botanists in a great number of plants, and the theoretical man can say *à priori*, by seeing the anatomical structure of the leaf, whether the plant needs a dry or a moist atmosphere. Take *Caryota propinqua*. The leaves, though coriaceous, have but a thin cuticle. The practical man might be misled by the strong leaves. He would think that such a plant might stand in the

open air, during summer, but that is by no means so. The plant will suffer from the first dry day, as was the case with a large specimen in the Vienna Botanical Garden. It was placed in a shady place, where no direct rays of the sun could reach it; the next day a dry, warm east wind was blowing, and this killed the plant in a couple of hours.

A third example. The leaves of *Primula sinensis*, as well as those of *Pelargonium zonale*, possess a great many glandular hairs, which are able to absorb ammonia, and a great many facts of the same kind are known to botanists. If gardeners knew this fact, they would give those plants an ammoniacal atmosphere.

Warmth and light are factors depending one on the other. Give a plant which grows in exposed situations in the tropics, where it receives the direct sun-rays, a situation in a hothouse in our climate, and it will sicken, as you cannot provide it with the requisite quantity of light in this climate, especially in hothouses. It will grow well if you will give it a temperature bearing a relation to the light available. This is the cause of the death of so many plants of the tropical regions in our hothouses. On the other hand, plants which grow in those regions under the shade of large trees, require from us a great quantity of warmth, although we can only give a little light. It would be a good thing to create horticultural experimental stations like those for agriculture. I should like to give you, in a second letter, a brief sketch of what such a horticultural experimental station should be. (*Our Berlin Correspondent.*)

BELGIAN NOTES.

[FROM OUR BELGIAN CORRESPONDENT.]

MEETING OF THE BRUSSELS ORCHIDÉENS.—First of all we must mention the new *Cattleya*, *C. Reine des Belges*; the plant and flowers of this suggest the idea that it may be a hybrid between *C. Mendeli* and *C. Trianae*, or between *gigas* and *Trianae*. MM. Vervaeck et Cie have received this variety, with many others, from a lover of Orchids in Columbia, who has cultivated such plants for several years, and who has settled himself in succession in three different districts of this country, which is so rich in fine Orchids. The petals and sepals of the variety we are now considering are of extraordinary length and breadth, and the lip is of great size, and in shape and colour midway between that of *Trianae* and that of *Mendeli*; the edges are much curved and waved, and of a superb dark colour, which is neither like that of *Trianae* nor that of *Mendeli*, but a cross between the two. A stem bearing two flowers will be sent to Messrs. Veitch, who are more likely than anyone else to appreciate and to describe it competently.

We must notice a new Orchid from M. Vuylsteke which resembles *Odontoglossum Schillerianum*, but the lip of it is white, much rounded, and spotted with quite tiny blood-red dots.

M. Linden showed a *Zygopetalum* (?), the lip of which was white, and which had sepals and petals of dark brown, the flowers exhaled a subtle perfume. M. Jules Hye showed some fine plants already mentioned in a notice of the meeting at Ghent. M. G. Warocqué had a variety of *Odontoglossum*; a spotted specimen of *O. Pescatorei*, and a vigorous plant of a good variety of *O. cristatum*.

M. Wallaert showed a *Cattleya Trianae*, remarkable for the prominent streaks on the sepals and petals; these streaks are of the same dark colour as is the lip. The plant flowered three times, and always exhibited the same characteristics as on the first occasion; the foliage has been carefully noticed, and on it are found the streaks and markings of *O. Peetersi* and *O. Hardiana*. M. Miteau exhibited, among other noticeable plants, a fine variety of *Cyclopogon cristata Lemoniana*, with large petals, and of good habit. M. Linden had some fine specimens of *Cattleya Trianae* and *Odontoglossum triumphans*.

LIÈGE.—A *Livingstonia chinensis* of unusual size has recently been cut down in the Botanic Garden of Liège. The trunk measured more than 35 feet in

height, the crown contained fifty-eight well formed leaves, eight nearly formed, or some which were scarcely visible.

BRUSSELS.—Plans have been prepared for the construction of an annexe to be erected in that part of the Botanic Garden, of Brussels, which faces the Rue Botanique. This annexe is to contain a hall for exhibitions of plants, a lecture-room, library, &c.

Le Journal des Orchidées. Under this title has appeared the first number of a practical cultural guide, published fortnightly under the editorship of M. Lucien Linden, director of "L'Orticultrice Internationale," and secretary to the "Orchidéens."

KEW NOTES.

THE WILD GARDEN.—This delightful spot at Kew has within the last few days assumed quite a gay aspect. The golden coloured Crocuses—the large purples and whites, besides the numerous and varied species all mixed together, looking as if they really liked their Kew home. Hellebores of the orientalis group, in variety; the Glory of the Snow—Chionodoxa Luciliae, is quite naturalized. Scilla bifolia, and S. sibirica, Snowdrops, the Giant Elwesii, as well as large patches of the old type. Innumerable flowers of many varieties of Daffodils, the most plentiful being *Pallidus praecox*, which has been planted on the high ground, and is now nicely in flower. On the lower ground, near the Cumberland Gate, and facing the rock-garden, is a sea of double varieties of Narcissus—*N. odoratus*, the common daffodil, and various others. The experiment with Hyacinths and Tulips on the sunny side facing the Palm House does not seem to have turned out as was expected, as the blooms are not so strong or numerous as last year. Close by here is a fine group of Scarlet Anemones; and *Hepaticas* are flowering nicely.

Anemone blanda, now nicely in flower in the rock garden, is one of the most charming of all the windflowers we have yet seen in gardens. Beginning to flower with the Snowdrop and Christmas Rose towards the middle or end of December, it has been continuously in flower until the present, and although perhaps showing only a few flowers at a time, their fine rich tint is much deeper than in those of *A. pennina*, are very welcome whenever we have a spell of open weather. *A. blanda* has been rather a scarce plant, but we believe a large importation has been received from Armenia, and we now hope to see it established in every garden; Mr. Ingram, at Belvoir Castle Gardens, has established it in the wild garden at that place, where it seeds freely, and forms a large patch. *A. pennina* is already showing flower, and though not so desirable in point of beauty as *blanda*, it flowers much later, and may be used with advantage to follow that species. *A. a. alba*—the pure white form, is a very charming rock plant, and where planted in sheltered nooks, it shows flower early in March, and continues in bloom until the middle of April. *D.*

AOTUS GRACILLIMA.

Of the comparatively few New Holland plants which find favour now-a-days in gardens, this is one of the prettiest and most easily grown. In habit, it much resembles *Epancis*, having long, slender, and extremely graceful shoots, thickly clothed with small dark green leaves. Shoots from 1 to 2 feet long are made in a single season, the greater portion being covered with flowers during the months of March and April. The plants belong to Leguminosae, and is nearly allied to *Pultenaea*. The small pea-flowers are yellow with a few brownish-crimson markings. It is now flowering in the temperate-house at Kew, a bush 3 feet high, and as much through, being planted out in the beds. For decorative work, however, plants in 6 or 8-inch pots are the most useful. After flowering, the shoots should be shortened back nearly to the old wood, and the plants given rather close and moist conditions. When the new growth is about 2 inches long,

they may, if necessary, be repotted; they prefer, however, rather small pots. A compost of peat, leaf-soil, and sand is the best for them, and an ordinary greenhouse temperature throughout the year. Propagation is effected by the young shoots when about 2 inches long, with a beel of the old wood attached, and inserting them firmly in pots of very sandy peat, covering with a bell glass.

CAMELLIA RETICULATA.

Beyond the numerous forms of *C. japonica*, this genus is but little known in gardens. At Kew about half-a-dozen distinct species are grown which show the genus to have a wide range in habit as well as in

FIG. 51.—THE BULL MITE IN VARIOUS STAGES, SEE P. 360.

the shape and size of the flowers. The finest of all is undoubtedly *C. reticulata*. The flowers are an admirable contrast to the stiff, formal blooms of *C. japonica*. We have seen this species in fine condition in the Horticultural Society's garden at Chiswick. The leaves are deep green, leathery, and reticulated as the name implies; and altogether the plant is most desirable, well worthy of a more extensive cultivation. *H. B.*

THE ART OF LANDSCAPE GARDENING.—Mr. A. M. KETTLERWELL has published a small pamphlet, setting forth some of the principles of landscape gardening, and has said as much as his very limited space will allow. Surely it is an error to describe a tree as the noblest object of inanimate nature.

IRIS SINDJARENSIS.

(BOISS AND HAUSSK, *sp. nov.*)

This novelty, thanks to the enthusiasm and energy of M. Leitchlin of Baden-Baden, has just flowered for the first time at Kew, and although not deserving a very high place as a garden plant, it may be called passable, and it is one that will appeal to many growers of hardy plants on account of its early flowering. In the *Flora Orientalis* it is placed between *I. palestina* and *I. Stocksii*, and is not very far removed from the well known *I. caucasia*, which it very much resembles in habit and general appearance. There seems to be quite a group of Irises nearly allied to *I. Sindjarensis*, which so far as we know have not yet been introduced to cultivation, *I. Stocksii*, *I. fumosa*, and *I. Aitchisonii* being prominent amongst the number. From *I. palestina* it differs in being many instead of one flowered, in the longer and much narrower leaves, besides other minor differences in the shape of the floral organs. In *I. Sindjarensis* the bulb is elongate oblong, and in this it resembles *I. orchiooides* more nearly than *I. caucasia*. The leaves 1 to 1½ inch broad, 6 to 8 inches long, lanceolate, acute, distichous, bright glossy green, the margins irregularly undulated, flowers 3 to 5, produced from the base of the upper leaves, of an almost uniform pale blue colour; stamens reflexed, obovate, pale blue, falls pale blue with darker blue lines, crest prominent, and yellow marked to the base with purple, and yellow bars; styles pale blue, darker towards the base; anthers and filaments, white. The plant is found in the deserts of Mesopotamia, and at the foot of the Sindjar and Gebel mountains, Takatak. It flowers in May. *D. Dewar.*

HOME CORRESPONDENCE.

QUASSIA, BIRDS, AND BUDS.—Under the heading of "Birds and Flowers" your correspondent, the Rev. C. Wolley Dod, p. 297, states that birds do not like anything that has a bitter taste, he having found that by syringing his Crocuses with an infusion of Quassia chips it prevented sparrows and pheasants from touching them, and he also hints that the same might be applied to our fruit buds as a preventative of the depredations of bullfinches. Now this might prove misleading, and cause annoyance to gardeners who may have to guard their bushes and trees against these birds, for it has been proved that they readily take the buds from Plums, Currants and Gooseberries after Quassia water has been sprinkled over the bushes, and also if soot and lime were added to the Quassia water. Bullfinches will destroy the buds of the black Currant, which I have never known them to do before last year; and a friend tells me that his black Currant bushes have suffered also this year. Netting the bushes is not always a protection unless it be fine meshed, for the bullfinch will get through it, so that nothing remains to be done but to shoot the birds. *A. Bishop.*

POTATO PLANTING.—It will not be a matter for surprise if Potato breadths be planted somewhat earlier than usual this year. Certainly it is not prudent to take anything relating to the weather for granted; but judging by its present aspect there seem to be specially favourable conditions for planting. Ordinarily, April is the best Potato-planting month, and so it should be at all times for first early varieties; but late sorts, the tubers of which lie dormant at least a couple of weeks longer than do those of early varieties, may be planted in March with assured safety, as probably fully five weeks will elapse before growth appears above ground. It may be asked "What advantage is gained by planting so early, if growth is not accelerated?" Well, the fact is, growth does take place below the surface, if slowly at least surely. So soon as the shoots break from the eyes of the tubers, they throw out rootlets, and these establish themselves in the soil, so that by the time the shoots are aboveground the roots have become strong, and capable of giving support to the shoots. When tubers are planted later, the soil being warmer, and the sunlight powerfully attractive, shoots are drawn up through the soil at a fast before the roots are thrown out, and the plants are far

less able to withstand heat and drought than are those from earlier planted sets. Of course there is to be faced in all cases the danger arising from late spring frosts, but that is ever a danger, plant either

so early only where there are no such visitants as late spring frosts, or some protection can be given to the tender tops. Planting all the same must be dependent upon the condition of soil, and favourable

ing so strong and stiff that a worse planting season could hardly be remembered. Now the soil is the very converse, especially where recently broken up. No wonder that such admirable conditions are being availed of, and generally large breadths are being planted, whilst the sowings are more than usually considerable. Throughout the market garden districts of Middlesex, Potatoes are planted with the aid of the dibber. The old practice of planting in the furrow before the plough, seems to have died out considerably. By that arrangement not only were the sets laid on to the hard base left by the plough, but the whole body of the following ridge of soil was thrown open upon them, giving a thick and sometimes hard body of covering for the tender shoots to struggle through. Planting with the dibber leads to the sets being inserted in the furrows left by the plough, the slight hardening of the soil about the sets made by the dibber being rather helpful than otherwise. The sets are in that way also buried somewhat more shallow, and being covered with loose soil by the hoes, have a comparatively easy matter to get well through. It is the rule, however, to well cross-harrow the soil after the planting is done, and, so left, not only are the sets evenly covered, but the surface is in admirable tilth for flat-hoeing later. By dibbling into every third furrow, a width of about 27 inches, all trouble as to marking out lines is avoided. Dibbling when the soil has previously been deeply worked, facilitates planting rapidly, and that is advantageous where extensive breadths have to be got in. In a private garden, 100 rods of Potatoes may seem a big breadth; but some of our market growers plant 100 acres, and it is a very heavy job. Even then, after-cultivation includes considerable labour; but the horse-hoe is a most valuable implement, of which we have no counterpart in ordinary garden cultivation; but then our soil is, as a rule more deeply worked, and gets in the planting less hard tramping. The horse-hoe enables the surface-soil to be moved fully 1 inches deep between the rows of Potatoes, and destroys weeds at the same time. Then the moulching plough follows after, and completes the cultivation needed till the digging time comes. Some of the labour may seem to private gardeners to partake of the rough-and-ready sort; but it is pretty successful, and fairly cheap—a great necessity now when good Potatoes sell from the ground at £3 per ton. *J. D.*

SWEET SCABIOUS.—This is exceedingly useful for cutting from, and from a packet of seed many beautiful coloured varieties are produced. If wanted for bedding out to bloom this season, the seed should be sown at once and placed in heat, and when the seedlings are large enough potted up into 60-sized pots. To form bushy plants pinch out the centre of each plant when about 6 inches high. The tall variety, which as a rule attains the height of 2 feet, is very suitable for filling up back rows in borders, while the dwarfs make handsome beds. *H. M.*

DAPHNE CNEORUM.—This charming little trailing but compact shrub should be grown wherever the soil is favourable. It delights in peat and in very free moist soils, but in dry and stiff soils usually proves a failure, but where once it is seen to flourish its planting should be extended. It grows from 6 to 10 inches in height, and bears a multitude of rosy-lilac flowers, with unopened buds of crimson in July. The flower heads are very compact, and so deliciously sweet scented that where much grown the air often seems charged with its fragrance. It is a beautiful object as an edging round dwarf shrubs in the American garden, where I use it. In front of mixed borders a margin here and there should be finished off at the grass line; it is a most useful plant to cut from, standing well afterwards. It makes up well into button-holes if mixed with the finely small cut, or oak-leaf Geranium. It is usually increased by layers. *A. Evans, Lytch Hill.*

SEEDLING DENDROBE.—I have at the present time a seedling *Dendrobium Devonianum* bearing three flowers, it being twenty three months from the time of sowing the seed. The first pseudobulb was 1 inch in length, the second 9 inches. Is not this rather quick for a seedling *Dendrobe* to flower? *J. Eberton, Harringay Park, N.*

EUCHARIS AMAZONICA.—An illustration of a nice pot of *Eucharis*, with thirty-six spikes, was given at p. 133, but I would venture to ask what your correspondent would think of a plant with over 200 spikes, which was the number on our plant this

FIG. 55.—IRIS SINDJARENSIS. (SEE P. 364.)

in March or April, as late spring frosts are erratic, and never more harmful than when they come in May. If precocious sprouting varieties of Potatoes be planted so early as March, great risk is run as to the effect of spring frosts in April, and it is safe to plant

for planting as that condition now is, it is wiser on the whole to take all risks and plant early than it is to wait until April, and to find that heavy rains have saturated the ground, and rendered it for the time unworkable. At this time last year the ground was work-

winter. From a cultural point, too, I would say, that there is more difficulty in obtaining a nice bloom in February than in autumn. For the last twelve years we have not considered it an unusual occurrence to have a pot of *Encharis* with fifty or more spikes of flowers. Some years since one of our plants, no larger than the one illustrated, bore about 100 spikes of flower in one year—forty-nine spikes at the first flowering, and the rest in two other flowerings within the year. After the flowering of this fine pot, which was a 15-inch one, the bulbs were divided, they having been excessively crowded together in the pot. Our treatment is just the ordinary one of a plant stove—60° to 65° in winter, and 90° in the daytime in the summer. We employ *Encharis* in part as a base on which to stand specimen *Crotons*, *Isoras*, and other tall plants. They have shade in summer, when it can be afforded them without injury to other plants. I have tried to grow *Encharis* in pans, as it is not a deep-rooting plant; but I prefer the pots as having more soil, and keeping a damper bottom than pans. I never use bones in the soil, which consists of half peat and loam. Manure-water is never given overhead. In the summer, or when growing fast, we are not afraid to give them water; but in winter the greater part is afforded by means of the syringe. *R. M.*

CUTTINGS.—Where flower-beds are many, there are large numbers of plants required to fill them in a satisfactory manner, and there is yet time to propagate soft-wooded plants for this purpose. The gardener is often hampered for want of what he thinks is a suitable place in which to strike the cuttings, but given a hotbed of leaves and dung, much can be done in this way and for raising seedlings. Long dung as it comes from the stables, and tree leaves, preferably Oak, Chestnut, or Beech, in about equal proportions, should be thrown together to get heated, and afterwards turned over twice or thrice in the course of ten days or a fortnight to sweeten before being made into a bed of about 5 feet high at the back and 4 feet at the front, and about 6 inches larger than the frame that will be placed on it; putting sufficient of the fermenting materials inside the frame to raise the bed to within 4 or 5 inches of the glass, after that enough sawdust, leaf-mould, coal-ashes, so as to be able to plunge the cutting-pots to the rims. Afterwards make up linings with dung and leaves about 15 inches wide all round, and up to the top of the frame, more at this time of year with a view to keep the cold out than to impart heat to the interior of frame. *H. W. Ward.*

THALICTRUM MINUS (MEADOW RUE).—It is surprising that this plant has not recommended itself more strongly since the rage for cut flowers and self-adornments has set in. It is a native of Britain. The leaves of the plant are equally well adapted for mingling with cut flowers, as is the *Adiantum*, and better in one respect. Its growths are of a pretty firm and wiry nature, and do not fade quickly, like those of the Fern. It will thrive in almost any soil, forms an excellent subject in the mixed border, gives no trouble after planting, if a little attention is paid to it as regards pinching off the flowers, which are small and inconspicuous. Grown in a pot and plunged, it does well on the rockwork, and is as hardy as the common Dandelion. There are numerous other species, but this is much the best for the purposes I recommend. *A. Evans, Lofthill.*

THE WINTER AND PARSLEY.—This comparatively open or mild winter has proved far more destructive to Parsley than that of 1889, or any previous ones for ten years. This is the more surprising as the destruction of the Parsley happened long before the really severe frosts of March. In not a few gardens the destruction is complete, not a living crown nor a green leaf seems left, and this notwithstanding the warnings suggested by last winter. Either our curled strains are becoming more tender, or mild winters have more destructive force over Parsley than the old-fashioned ones of average severity. *D. T. F.*

THE FROST AS A ROSE PRUNER.—It came sharp and strong at last, and cut not a few of the tender varieties back to the ground line, but seldom has it found such a profusion of green food as this March. Some had already done their first pruning, cutting back to dormant buds; but I think that a mistake. As soon as the Roses feel the first cut of the knife the dormant buds become active, and now those early pruned Roses have those base buds that ought to have slept till April frozen black as

one's hat, though they have few or no successors. *Rosa.*

THE LATE FROSTS.—The late severe frost came on us so suddenly, that the Apricots which we could not protect fared very badly, but the Peaches, fortunately, escaped injury, the buds not having burst; but at the present time they are fully expanded. We registered, on March 4, 22° of frost, our thermometer (a Dolland) standing 3 feet from the surface of the ground, facing north-east. *W. L., Newbridge House, Bath.*

PLAGIOLIRION HORSMANII.—In reference to Sir Chas. Strickland's query in the issue of the *Gardeners' Chronicle*, for March 8, as to whether *Plagiolirion Horsmanii* was planted out in the open ground at Messrs. Sander & Co.'s, I am able to inform him that it is not, but is planted in a border in the new Cattleya-house, and therefore is subjected to the same temperature as is given to the Cattleyas. I fear that this plant will never be grown out of doors in this country the year round, but it is possible to grow it in a warm and somewhat damp and shady spot during the summer months, and afterwards under shelter during the winter; but this course would probably hinder free blooming. *John Weathers.*

PLANT SHELTERS.—I have found the shelters of which I wrote to you on October 22, 1887, p. 593, and again on December 14, 1889, p. 709, so very useful in the sudden great changes of weather to which we have been lately exposed, that I will ask you to find room for another short notice. The Osier coops which we first used, though protected by the green screen, cannot, I fear, last for many years; we have, therefore, had frames made of galvanised iron wire. These are quite light to carry, and may be made of the size of an ordinary round hen-coop at about 2s. each, and in sets of 1 foot, each, and 12, 13, 14, and 15 inches across at about 100, each shelter. So far, we have only had the coop size in use, but I have no doubt the smaller size will be sufficient to protect small plants in flower from frost and rough weather. Cyclamen Atkinsii has been for some time in great beauty with us, and many of the species of *Crocus* and other spring flowers. The thermometer on a little house in Wisley wood fell to 8°; the shelters have, therefore, been well tried. They should also be of service placed over newly moved plants, and to shade flowers. *George F. Wilson.*

DIANTHUS CHINENSIS, DOUBLE.—There is still plenty of time if the seed be sown at once to get plants large enough to plant out by the middle of May. The flowers are very useful for cutting from and arranging lightly in vases; they last a long time in water, and some of the doubles are not far short of *Picotetes* in size. When rearing the *Dianthus* for bedding out, care should be taken that the plants are not drawn up, or they become soft and seldom flower satisfactorily when put out. Sow in pans or shallow boxes, place them in heat, and when the plants get fairly well established grow them on as hardy as possible. *H. Markham.*

A DISTINGUISHED VISITOR.—An admirable opportunity will offer on Tuesday next at the Drill Hall, Westminster, for paying a distinguished visitor of the meetings of the Royal Horticultural Society a merited compliment. I think I stand almost alone in urging that whenever specially distinguished horticulturists visit the meetings, the superintendent or the hon. secretary of the Society should have authority to invite such persons to take seats at the various committee tables, according to choice or fitness, for the time as honorary members. The suggestion perhaps, because it is made outside and not from within the council, has never been adopted. The result is that when men of exceptional eminence attend the meetings, if not one of the council elect, they are shut out for the time from taking part in the meeting's proceedings. The result is an apparent evidence of uncourtousness and of isolation. On Tuesday next that undoubtedly eminent French horticulturist, Mr. H. de Vilmorin, will be visiting the Drill Hall. He has been thought worthy of an invite to read a paper in the afternoon on *Saladings*, and yet under the restricted regulations which now govern the construction of the Society's committees, he is not eligible to sit at the table of either of those bodies. [He may be invited by the chairman, and at any rate we know that course has been followed. Ed.] None the less, Mr. de Vilmorin is a horticultural giant, as

compared with many of those now privileged to sit on those committees. Mr. W. Ingram, who follows Mr. de Vilmorin at the first April meeting, is happily a sort of honorary member of the Floral Committee, for his opportunities of attendance are few; but Mr. Wolley Dod, who reads on April 22, is on neither of the permanent committees, unless the Scientific Committee is to be included in that term. [Certainly. Ed.] Why not make all readers of papers for the year honorary members of all the permanent committees for the period, so that when present they may sit with which body they prefer? *A. D.*

TECOPHILEA CYANEO-CROCEA.—This is undoubtedly one of the most beautiful of half-hardy spring flowering plants. The flowers are funnel-shaped, much resembling those of *Convolvulus*, and of the shade of blue found in *Gentiana aculalis*. Small bulbs are only flowered at first, but as they increase in size, several are produced in succession for the space of two months. Although it might be hardy in some localities, it is preferable to give the plants the shelter of a cold frame—planting the bulbs in light sandy soil. Reproduction is by means of seed and division of the bulbs. *G. R.*

HOME-GROWN LILY OF THE VALLEY.—At one time it was thought that Lily of the Valley could not be grown in England equal to that imported, but this idea is now exploded by Mr. Jannach, of Dersingham, who cultivates roots for the market, and by Mr. Wallis, gr. to Captain Prettyman at Orwell Park, who grows all that he requires for forcing and gathering from in the open, and the spikes number twenty to twenty-five large bells each. There are several varieties of the plant, and if Mr. Wallis will tell us how he started with his stock, and the plan he adopts, he will be conferring a benefit on many readers of the *Gardeners' Chronicle*. *J. Sheppard.*

GILLYFLOWERS.—Mention on page 259 of these flowers remind us of the objection shown towards them or rather the striped or pied forms (so very common even now in gardens), by Perdita, in Shakespeare's *Winter's Tale*. That Shakespeare in putting certain expressions respecting striped flowers into Perdita's mouth has thus given utterance to his own opinions there can be no doubt, opinions still largely shared in so far as the true Gillyflowers, both by the poet and Tusser, as well apparently of the Tudor age, Stocks and Wallflowers are concerned. If we do not designate striped Stocks and Wallflowers as bastards, it is not because we do not think them to be such, but rather seek for more refined terms to apply. It would seem as if Perdita's dislike to striped Stocks and Wallflowers extended to Carnations also, and it may have been, no mention being made of others; that all, or at least most, of the Carnations of that age were flaked or striped. But the objection entertained to pied Gillyflower now does not extend to Carnations, at least, not with the florist, although there are some gardeners who greatly prefer the self colours found with us so abundantly in gardens. We are so much the better off than was poor Perdita, that, whilst we have a multitude of garden flowers which are not pied, our Wallflowers and Stocks show that defect only in inferior strains. That it was the practice in Shakespeare's day to propagate Stocks and Wallflowers too, by means of cuttings would seem evident from Perdita's observations, unless the remarks as to cuttings be limited to Carnations only. The references by Tusser and other gardeners of some 350 years ago, seem to settle conclusively the point as to what flowers were designated Gillyflowers by our forefathers, and in some rural districts the term seems now better known than it is by educated people. *A. D.*

SHRUBBERIES.

The principal object of forming belts or clumps of evergreen or deciduous shrubs or trees in the vicinity of residences and gardens, &c., is generally that of separating certain portions of the grounds from others, the concealing of what may be considered as unsightly objects, if any such exist, as well as for the purpose of affording shelter and seclusion to walks, drives, &c. Where all this is skilfully accomplished it not unfrequently has the effect of making grounds of but limited extent appear larger than they really are; still there is probably no part of a garden more frequently mismanaged than the shrubberies; and

this circumstance may possibly, in some measure, be ascribed to the system usually followed of planting them with a mixture of species of plants, and this often without regard to the habit of growth and the ultimate dimensions to which the plants will in course of time attain, and the consequence is a struggle for life, in which the weaker (although often the choicer) plants will of necessity get worsted: and this in the pleasure-garden, where everything ought to afford pleasure and enjoyment. To avoid these mishaps, the choicer and the dwarfier growing species should be placed near to the margin of the belt or clump, and strong and rapid-growing species of plants towards the back or central parts. A still better plan, however, is that of following a judicious system of grouping, which will afford a sufficient scope for variety, and in all respects is more satisfactory than a mixed plantation.

Nearly all evergreen shrubs show to more advantage in groups than when mixed with other things, and these groups may be so selected as regards their contents, and disposed as to effect, that every desired object is obtained, namely shelter, separation of the various parts of the grounds from each other, &c. The Common Holly is an admirable and effective group-plant, and the gold and silver margined varieties are exceedingly ornamental when thus planted, while the same plants placed in a mixed shrubbery lose much of their effect, or appear out of place. The same may be said of the Common Yew and its variegated and other varieties. The Arbutus is a fine free flowering evergreen plant that forms a beautiful group, or solitary plant, although during exceptionally severe winters, if occupying a low or damp situation, it is apt to get injured; and the same may be said of the Laurustinus and the Aucuba, in most of its varieties. On the other hand, the Rhododendron and many so-called American plants are perfectly hardy, and are too well known to require anything to be said in their praise. These it is usual to plant in groups by themselves, and generally because of their requiring peat or light sandy loam, and which has mostly to be brought from a distance. Nearly every evergreen and deciduous species of shrub is adapted to form a group, large or small, according to habit and height to which it grows, &c. The common Laurel is a plant very freely used in the planting of shrubberies. It is nevertheless far from being the most suitable plant for this purpose, as in some kinds of soil it does not continue in a healthy state for many years, and during severe winters it is frequently injured, which is not the case with the Portugal Laurel, a very much hardier plant, and one in all respects to be preferred to the former.

In cases where it is desirable to form groups of tall growing deciduous trees, the necessarily wide spaces between such trees may with advantage be planted with dwarf growing evergreen plants, many varieties of which are known to succeed under the shade of trees, such as the Tree Box, Mahonia aquifolia, and other Berberis, or even the common Irish Ivy, Butcher's Broom. It is, of course, desirable to produce a pleasing effect during winter as well as in summer, and the desired effect of a plantation is thought by some to be impaired during winter by the leafless condition of plants that are bare of leaves at that time, and when the primary object of the group or belt is that of shelter or protection, deciduous species should be altogether excluded, as it is during the winter and spring months when the warmth and shelter of a plantation of evergreens is most appreciated. [Is there no beauty in the buds and twigs in winter, and in the signs of returning life in the spring? Ed.] In cases where the mixed shrubbery may be preferred to an arrangement of groups, each group consisting of one species, as has been already recommended, the habit of growth, and the dimensions to which the various specimens will be likely to attain, should be well considered, and the specimens planted at such a distance from each other as to admit of the natural development of the plants; while the necessarily somewhat wide spaces between the plants, which are

destined ultimately to form the plantation, may, in order to produce an immediate effect—if that be desirable—be filled up with the common species, which may be removed when it becomes necessary to give more space to the others.

The margin of shrubberies or groups are sometimes occupied by herbaceous plants, which, though somewhat incongruous, may have nevertheless a pretty effect during the summer, but they detract from the beauty of the pleasure-grounds in winter by allowing so much bare soil to be seen. There are, however, abundance of dwarf shrubs, which are ornamental at all seasons, and much better suited for the purpose than herbaceous plants, such as the Mezerium, Cornus mascula variegata, which commences to bloom early in January, and is ornamental at all seasons; Potentilla fruticosa, or the shrubby Cinqufoil; the Prickly Broom, many species of the Cistus, or Rock Rose; Cotoneasters, Ribes, Genistas, hardy winter-flowering Heaths, &c.; and to these may with advantage be added a fringe of winter Aconite or Snowdrops, P. G. [Ajuga reptans, Saxifragas, Ivies, Hepaticas, Violas, Carnations, early-flowering Daphnids, Sedums, Skimmias, are all good things for filling in the foreground of groups and belts when the bare earth is disliked. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

MARCH 11.—Professor Church in the chair. Present, Messrs. Blandford, Wilks, Morris, Drs. Hugo Müller, Frank Oliver, Scott, Masters, and Professor Marshall Ward.

Effects of London Fog on Plants.—Mr. Morris read the terms of an application for a sum of money from the Government grant administered by the Royal Society, to be devoted to the partial payment of the expenses connected with the inquiry into the composition of London fog, with special reference to those of its constituents that are injurious to plants.

Fruit of Loranthus.—Mr. Morris stated, on the authority of Professor Oliver, that the fruit of Loranthus attached to the panicle of the Sugar-cane, as exhibited at a previous meeting, was *L. americanus*.

Sugar-cane Borer.—Mr. Blandford reported that the moth mentioned at the last meeting, as injuring Sugar-canes in St. Vincent, was *Diatraea saccharalis*. The beetle alluded to on the same occasion is known as *Xylorhynchus perforans*, and was originally described by Wollaston in his *Catalogue of the Coleoptera of Madeira*, p. 38. It occasions great injury to the buds of the wine casks in Madeira. Wollaston found it commonly feeding in the stems of *Jatropha curcas*.

Seedlings of Sugar-cane.—Mr. Morris, in continuation of information placed before the committee on December 10 exhibited specimens of mature seeds of the common Sugar-cane (*Saccharum officinarum*). There were also shown germinating seeds, some plants, drawings of the flower, and dissections of the fruit (caryopsis) in detail. Mr. Morris stated that there appeared to be no authentic record of any really wild station for the Sugar-cane. Further that the fruit of the Sugar-cane had not hitherto been figured or described. At Barbados several times during the last twenty years, and more recently by Professor Harrison and Mr. Bouch, self-sown seedlings of the Sugar-cane had been observed. The subject was taken up systematically in 1858, and about sixty of the seedlings had been raised to mature canes. Many of these exhibited well-marked characteristics, differing from the varieties growing near them.

Careful inquiry had shown that canes known as the "Purple Transparent" and "White Transparent," and possibly also the "Bourbon" cane, produced seeds in very moderate quantities. Spikelets received at Kew had been examined and the seed found *in situ*. A description with figures had recently been laid before the Linnean Society by Mr. Morris. It is anticipated that by cross-fertilisation, and a careful selection of seedlings, it will now be possible to raise new and improved varieties of Sugar-cane, and renew the constitutional vigour of plants that have become deteriorated through continuous cultivation by cuttings or slips. Great importance

is attached to the subject in Sugar producing countries, as it opens up an entirely new field of investigation in regard to Sugar-cane cultivation.

EDINBURGH BOTANICAL.

MARCH 13.—The Society met in the evening at St. Andrew Square, Mr. Lindsay, President, in the chair. The following communications were made:—

1. "On the Nature of the Rings of Wood in some Species of Trees in Central Uruguay." With Microscopic Demonstration. By David Christison, M.D., F.R.S.E.

2. "Notes on Recent Additions to the Flora of the Moffat District." By J. Thorburn Johnston, Moffat. Communicated by Professor Balfour.

3. "Notes to aid in a further knowledge of the Products of North-western Afghanistan and of North-eastern Persia." By J. E. T. Aitchison, M.D., C.I.E., F.R.S.

4. "Exhibition of the Type-specimens of Indian Grasses used by Mr. W. Coldstream in the illustration of his 'Grasses of the Southern Panjab,' and now presented to the Society." By Hugh F. C. Cleghorn, M.D., LL.D., F.R.S.E., F.L.S.

5. "Microscopic Demonstration of the Tissues of some Plant-hybrids and of their Parents." By J. M. Macfarlane, D.Sc., F.R.S.E.

6. "On Temperature and Vegetation at the Royal Botanic Garden." By R. Lindsay, Curator.

Report on the Open-air Vegetation in the Edinburgh Botanic Garden for February.—The month of February has been, on the whole, favourable, having been dry and cold generally. The thermometer was at or below freezing point on nineteen mornings, indicating collectively 101 of frost for the month, as against 103 $\frac{1}{2}$ for the corresponding month last year. No very low readings were registered, the lowest being on the 6th, 21 $\frac{1}{2}$; 7th, 22 $\frac{1}{2}$; 8th, 22 $\frac{1}{2}$; 9th, 21 $\frac{1}{2}$; 11th, 21 $\frac{1}{2}$. The lowest day temperature was on the 8th, 34 $\frac{1}{2}$, and the highest on the 25th, 59 $\frac{1}{2}$. Slight falls of snow occurred on seven days, and rain on four days.

Vegetation generally is well forward. A large number of spring flowers are in blossom. Ribes, Thorns, Lilacs, and other hardy shrubs are fast starting into growth; deciduous trees, such as Elm, Poplar, and Alder, are bearing enormous quantities of flower-buds. Many half-hardy Australian and New Zealand plants are still quite safe in the open borders, without their having been protected from frost. Spring-flowering bulbs, having received but little check, are flowering very profusely, and are fully up to the average in richness and quality of blossom. There is every prospect of the season being a good and early one.

The following spring-flowering plants annually recorded to the Society came into flower in February, viz.:—*Symplectum caucasicum* and *Arabis albidula*, on the 1st; *Nordmannia cordifolia*, 2nd; *Scilla bifida*, 15th; *Iris reticulata*, 16th; *Mandragora vernalis*, 18th; *Sisyrinchium grandiflorum album*, 25th; *Scilla bifida*, alba, 28th.

On the rock garden, twenty-five species came into flower during the month, the most interesting being *Chionodoxa sardensis*, *Corydalis angustifolia*, *Crocus chionodoxus*, *Daphne Blagayana*, *Doronicum caucasicum*, *Eriocaulon carneum*, *Galanthus Helouletii*, *Iris reticulata*, *Narcissus autumnalis*, *Rhododendron praecox*, *Saxifraga oppositifolia*, *S. Bursariana multiflora*, *Scilla bifida* alba.

The following plants in flower were exhibited from the Royal Botanic Garden:—*Crocus imperati albidiflora*, *Chionodoxa sardensis*, *Daphne Blagayana*, *Narcissus cyclamineus*, *N. citrinus*, *Pinguicula lutea*, *Psydanthura barbata*, *Saxifraga Stracheyi*.

From Mr. Hanbury's garden at La Mortola, Ventimiglia, Italy, by Mr. Sewell: Fruits of species of *Coussida*, *Eucalyptus*, *Martynia*, *Solanum*, *Hakea*, and *Casuarina*, were exhibited.

Botanic Garden of Glasgow. Remarks on Temperature, Vegetation, &c., for February 1890.—The high mean temperature experienced last month, was continued for the first two or three days of this month, 7 of frost being registered on the night of the 1th. Since then we have had continued cold. Frost was registered on twenty nights, the remainder being very cold. The lowest reading was 23 $\frac{1}{2}$ (3 $\frac{1}{2}$ of frost), and the total frost for the month 87 $\frac{1}{2}$, and four times at the freezing point. Cold north and north-east winds were frequent, also an unusual number of hazy, foggy, sunless days. The warmth

of the sun was felt here only twice during the month, *i.e.*, on the 21st and 23rd. The continued cold days and nights have thoroughly retarded vegetation; this is a fortunate circumstance. Fortunately only hardy plants of foreign origin which, despite all acclimatization, will persist annually in pushing early growth, have suffered to any appreciable extent.

MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL.

MARCH 18.—The Council of the Royal Botanic and Horticultural determined to open the season with a flower show in the Town Hall. Unlike most of the exhibitions promoted by this Society, the intention was to have a variety of exhibits from nurserymen and gentlemen—more of the general order—to give the citizens an opportunity of seeing what can be done in general, rather than in the formal arrangements of subjects set down for exhibition. That they succeeded in bringing out a lot of specially fine contributions almost goes without saying. And what enhances the importance of an exhibition from a sight-seeing, and therefore paying, point of view, the day was splendid. Even the murky canopy that generally hangs over Cottonopolis had disappeared, and the public flocked in such numbers as must have given general satisfaction to all concerned.

The group of plants in the post of honour towards the orchestra was contributed by the Botanic Gardens, and Mr. Findlay put up a very showy and imposing group, consisting of both pinnated-leaved and fern-leaved forms, of such as *Cocos plumosus*, *C. Weddiana*, *Areca lutescens*, *Kentias* of sorts, and some *Latanias*. The foreground was brightened with a grand lot of well-grown *Ilyacincths* of the popular kinds, that have been in exhibit for years, and seem yet to hold ground against all rivals. Then *Azalea amena*, *Cliveas* in great floriferousness, pleonotic *Deutzias* and *Lily* of the Valley, and a nice contribution of the showy cut-leaved Japanese *Aceres*, made up an imposing group; a couple of very nice *Dendrobium Wardianum*, one in particular beautifully flowered, and grown in a teak basket, that almost toppled over with the weight of the plant above it. A good form of flamed *Cattleya Triana* was on exhibit, and bears the name of the Trafford variety. It has size, substance, and pronounced colour about it, and will beat many hundreds that come against it.

The next most important contribution came from Mr. Statton, Stand Hall, Whitefield; his *Dendrobiums*, particularly *Ainsworthianum*, and its variety, *roseum*—after the recent decease of the gentleman whose name they bear—attracted considerable attention. *D. Leechianum* appears to be a better flower than the *D. Ainsworthianum* roseum to which, by the way, it is closely allied. The lots of *D. nobile* shown were varied—none better than a chance imported plant, which had size, substance, and colour to recommend it; as an interesting hybrid, *D. Dominionum* ×, from the blood of *Lewinianum* and *nobile* combined, was interesting. A very pretty form of *Odontoglossum asperum* was shown, and very choice little plants (although, by the way, they never get big), of *Angraecum Sanderianum* and *A. Ellisii*.

Messrs. B. S. Williams & Son had a lot of about 100 *Ilyacincths*, in which *La Grandesse*, *Macaulay*, *Koh-in-noor*, *King of the Blues*, *Mimosa*, *Queen of the Blues*, *William III.*, *Malakoff*, *Von Schiller*, and *Pimslor*, a good blush, took precedence. These along with forced shrubs, *Guelldres Roses*, &c., and a lot of *Daffodils* and *Lily* of the Valleys, made up a showy contribution.

Dicksons, Chester, had a very nice lot of *Daffodils*, none better than *Horsfieldi* and *Emporer* for general work, although such as *albicans*, *Empress*, and some of the doubles look well. The *Bulbocodiums* struck the visitor by their formality. These, and *Spullis*, and *Chionodoxas*, made up a nice group. Dickson, Brown & Tate had a good well grown lot of *Ilyacincths* in pots, and a lot of *Narcissus* in glasses. Messrs. Cuthbert & Sons, Barnet, had a large contribution of the mixed order, their *Cyclamens* and *Mignonette* being very attractive, as were their white *Azaleas*—*Deutsche Perle* being in fine style. Mr. Hooley, Cheadle, had a miscellaneous lot of bulbous and New Holland plants clean and well grown.

Mr. Joseph Broome, Llandudno, had a charming lot of hardy herbaceous and bulbous plants culled from the open garden, and shown in bunches in boxes—there would be quite 150 of them. The double yellow *Wallflowers*, the various *Armerias*, the grand lot of *Primroses* and *Polyanthuses*, the

many *Violets*, and *Aubrietias*, the ragged-looking *Caucasian Scabions*, and several *Anemones*, made one long to live in a district where such things could be had out in the open. Mr. S. Barlow had a nice group of *Hepaticas*, and Mr. Mason had about as good a lot of memorial wreaths as one can well desire. The *Colognye cristata* and the white *Camellia*, together with sprays of *Lily* of the Valley and white *Lilac*, and suitable greenery, make up a captivating design for decoration of this character.

CHISWICK GARDENERS' ASSOCIATION.

MR. GEORGE CANNON, manager of Messrs. Charles Lee & Son's Ealing branch, read a very interesting, instructive, and practical paper on the outdoor cultivation of the Rose, before the members of this body on Friday, March 7. About the beginning of this century, Messrs. Lee, of Hammersmith, were giving attention to Roses, and they seem to have been the first growers of any importance in this country. Mr. James Lee (who wrote a work on botany), father of the present Mr. John Lee, and grandfather of Mr. W. Lee, the head of the present firm, was a very enterprising man; he sent collectors to many parts of the world for new plants, and very many novelties were thus introduced by the firm. It imported standard Roses from France in the year 1818, which were the first ever seen in England, and which were sold at one guinea a-piece. They continued to import large quantities of these Roses every year, and it is recorded that the Duke of Clarence gave the firm an order for 1000 plants at that sum. The Lees were also exhibitors of Roses, and were successful as such at the Horticultural Society's shows. In those days the blooms were shown on Japanese cases in tubes. Mr. Rivers in 1834 being the first to exhibit Roses in boxes upon green moss, and which practice has continued to the present time.

From a most interesting (indeed, it might be called historical) communication, kindly furnished by Mr. John Lee, it appears that this gentleman first entered the business in 1821, and his father first commenced planting standard Rose stocks for budding, and in the following year he made a purchase from a Mr. Calvert, a nurseryman in France, of 8000 standard Roses—accounted then a very large order—at 3s. each, which amounted to £1200. Mr. John Lee wrote the cheque in discharge of this account in 1822.

In those days there were no perpetual Roses, except the old Four-season and the Pasten Rose. The popular favourites at that period were the *Tuscany*, *Carmine*, *Celestial*, *African Black*, a host of other sorts of that stamp, and the Bath white *Moss de Menus*. In 1822 the Lees introduced those popular varieties *Lee's Crimson Perpetual* and *Lee's Blush Perfection*, and one or two new *Noisettes* and *Bourbon Roses*, the latter class being the progenitors of the H.P.'s of to-day. *Stanwell Perpetual* was raised at Messrs. Lee's *Stanwell Nursery*, near Bedford, the firm having a branch at this place at that time. This variety was introduced to commerce in 1823. At *Stanwell* were also raised at this period those popular *Hip Roses*, *Globe Hip*, *Margined Hip*, and *Blush Hip*, which commanded a great sale. A large collection of Scotch Roses were also raised by the firm at *Stanwell*, but these have long since been forgotten.

FLOWER SHOW IN SCILLY.

THE Isles of Scilly Bulb and Flower Association held their annual show in the hall of the public building, St. Mary's, on the 11th and 12th inst. The exhibits were much in excess of any previous year, and numbered over 1,100, chiefly *Narcissis*, and the quality of the flowers was excellent, some *Sir Watkin's Emperor*, *Empress*, single flowered. *Incomparabilis* and *Ornatius* were very fine. All of the flowers shown were grown out of doors, and such a large collection had never been seen before in March (what would Parkinson say to such a collection?).

The first day the exhibits were adjudged in classes; and on the second day each exhibitor put his exhibits into collections, and competed for special prizes. Mr. W. P. Mumford, of Old Town, was 1st, winning a challenge board with cup presented to the Association by Mr. Smith, the proprietor of the Islands; Mr. Mumford took the 1st prize on the first and second year of the show. His collection

numbered 90 varieties. Mr. F. Watts was 2nd with 117 varieties, a tankard worth ten guineas, presented by Mr. E. Jacobs of Covent Garden.

In addition to the above exhibits, Mr. Smith, of the Abbey (gr., Mr. Jenkins), staged 180 varieties of *Narcissis*, not for competition; the bank of flowers being backed with beautiful effect by *Arum Lilies* in bloom, *Araucarias*, *New Zealand Flax*, and various choice shrubs.

The flowers which obtained the 1st prize, Mr. Smith's exhibits, and other contributions by different exhibitors, were sent on for the acceptance of the Queen, who was pleased to acknowledge the receipt of them in a letter to Mr. Smith.

The arrangement of the exhibits were made by Mr. J. C. Tonkin. *A Correspondent.*

LAW NOTES.

A DISPUTED ACCOUNT.

RADCLYFFE & Co. v. PHILLIPS.—This case was brought in the Chertsey County Court by the plaintiffs, who are horticulturists and greenhouse manufacturers, London; defendant is medical superintendent of the Holloway Sanatorium, Virginia Water. Mr. Wilkinson, who conducted plaintiffs' case, said that the action was brought to recover £31 3s. 6d., of which £19 5s. had been paid into court, for certain plants and greenhouse blinds. The points at issue were whether the plants were supplied at a reasonable price, and whether the blinds were made and fitted in a proper and workable manner. Evidence was given by plaintiffs' traveller, Mr. Radclyffe, and the man who fixed the blinds, from which it appeared that when the plants were ordered by defendant's gardener, to whom the traveller had been referred, no price was agreed on, the only stipulation being that they should be delivered by Ascot day. The number of the blinds, and the manner of their fixing, was left to the discretion of the traveller. The blinds were returned about five or six weeks after delivery, but plaintiffs refused to take them in. The prices charged for the plants were the usual ones.—Mr. K. Brettell defended. The defence was that defendant's gardener agreed with plaintiffs' traveller as to the price of the plants. Defendant ordered one roller-blind, which was to be sent down before Ascot week. There was a delay in filling this order, and instead of one blind, four were sent and fixed. Defendant objected, but allowed them to be put up, as the hot sun was spoiling his plants. The blinds did not work satisfactorily, and the space between them admitted the sun. One was blown down the day after being fixed, and they were sent back in a few days afterwards. Evidence bearing out this was given by defendant, who also stated that he had spent more than £1000 in flowers within the last four years. He considered the plaintiff's prices excessive.—Dr. Phillips's head-gardener said the price charged for the plants was in excess of the sum agreed on.—His Honour held that the blinds were clearly useless, and that they had been returned within a reasonable time. Therefore defendant was not liable to pay for them, and he gave judgment for defendant on all points. *Surrey Advertiser and County Times, March 8.*

MR. A. VAN GEERT v. MESSRS. J. CARTER & Co.

In the report of the above action, which appeared last week in the *Gardeners' Chronicle*, it is said that—"As Mr. Van Geert would neither make any allowance, or replace the plants (which arrived in unsealable condition), Messrs. Carter & Co. were compelled to defend the action." Now, the evidence clearly proved that Mr. Van Geert was compelled to take the action, because Messrs. Carter not only declined to pay the invoice, or any part thereof, but even declined to accept the invoice, although they admitted that they could not account for the condition of the plants, unless they had sustained injury in transit, which took place at the end of August, 1889. It is also mentioned in the same report, that the defendants had no knowledge of the route the goods were sent by, but they

abl- as a manure, but its effects are transient. In 100 parts ox-blood there are 80 per cent. of water. Mix 50 gallons blood with 8 bushels of peat-ashes and charcoal-powder; let it stand two years before using. Clayey loam or powdered clay would do almost as well as these two ingredients. Dressing about 48 bushels per acre and for a Vine border in proportion. Blood may be dried, or partly dried-it is then not so leathery-and given as a top-dressing. It is more lasting in its effects if mixed with sawdust and tanners' bark. The land should be well drained, as when it is wet the effects of the manure are not so marked.

BOOKS.—BOTANY: Bertham & Hooker's *Genera Plantarum*, price 10*l.*; *The Handbook of the British Flora* by the same; *The Gardener's Assistant*, by R. Thompson. Edited by T. Moore, price 3*l.* 6*s.*; published by Blackie & Son, Paternoster Buildings; Glasgow and Edinburgh. *The Epitome of Gardening*, by Moore and Masters; A. Black & Co., 6*s.*

CAPE BULBS RECENTLY IMPORTED: *Constant Reader*. The *Ixia*, *Freesia*, *Tritonias*, *Babianias*, and *Ornithogalums*, should be carefully cleaned, washed, then dried for a few days in the sun. Prepare a compost of sandy loam and a little leaf-mould, and pot the bulbs very firmly, leaving them one-third of their height above the soil. If the soil be moist, no water should be given to the bulbs for a time. Plunge them in a mild tan or leaf bed, the heat of which should not exceed 70°, the top heat of the frame or pit being by day 65° to 70°, and by night 55° to 60°. Give no water until growth commences, and give no additions to the bottom or top heat except what is occasioned by the natural increase of temperature. When leaves are produced ventilate freely in mild weather, and encourage the plants to make as much leaf-growth as possible up to July, when water should be withheld gradually at first, and totally as soon as the foliage shows signs of maturity. The last-named bulb is an evergreen one, and needs some slight amount of watering during the autumn. After resting in their pots, the first four species of bulbs may be shaken out and re-potted, six to eight being put into a 4-sized pot, and afforded greenhouse or frame treatment.

CYCLAMEN: *N. E. L. L.* Sow seeds in early autumn—that is, as soon as ripe. Trick off the seedlings into good compost of loam, peat, leaf-mould, and sand, and when nicely rooted put into thimble and small 60*s.* Give a genial atmosphere, warmth at night during winter 55° to 60°, with an increase of a few degrees during the day. They should be kept gently growing from time of sowing the seed till the flower period. It is curious treatment for an alpine, but it answers. Plants that have once bloomed should be rested in a cool frame, either in pots or planted out in peaty soil, and in September be repotted and grown on, like the seedlings.

FERNS ROUND YOUNTAIN IN GREENHOUSE: *J. J. J.* *Pteris sermunda* and its varieties; Common Maiden Hair, *Adiantum*, *regalis*, *Ceratopteris thalictroides*, *Acrostichum aureum*, *Cyathea dealbata*, *Woodwardia radicans*, *Asplenium exelsa*

INSECTS: *T. T.* The insects which have attacked the roots of your Christmas Trees appear to be (as well as we can judge from the shrivelled state of the specimen sent) to be the larvae of the small common swift-moth (*Iteplialis fuscus*), often found eating the roots of pot plants. *I. O. W.*, *C. S. & Co.* The centipede you send is, as we learn on inquiry at the Natural History Museum, common in all tropical countries, and is named *Sclopendra subhyalina*.—*A. B.* The caterpillar of the Goat-moth, *Cossus ligniperda*, very destructive to young trees. Pass a hooked wire through the cavity and extract the creature. Smear the trees with clay or soft-soap to prevent the moth laying her eggs on the bark.—*A. I.* A mite; 2, Apple scale, *Aspidiotus conchiformis*. (See *Journal of Royal Horticultural Society*, vol. x., 1888, British Apples, with cuts from the *Gardener's Chronicle*.)

MELONS AND CUCUMBERS: *G. W.* Bad Melons may taste very much like cucumbers, and no wonder seeing their near relationship. It is all nonsense to suppose the ants in the house have any thing to do with the matter.

NAMES OF PLANTS: *J. C.* 1, Probably *Cedrus Deodara*; 2, *Picea morinda*; 3, *Lobocedrus chilensis*; 4, *Retinospora obtusa* aurea; 5, *Cupressus*, pro-

bably *Govieniana*; 6, Probably *Cedrus atlantica*.—*K. and B. C.* 1, *Diplopappus chrysophyllus*; 2, *Cornus Mas*.—*F. N.* *Rhamnus alaternus*.—*E. M.* Quite impossible to name your withered scrap with certainty. Probably your conjecture is right.—*G. W. C.* *Odontoglossum Ruckertianum*, *J. S.* 1, *Isolepis gracilis*; 2, *Panicum variegata*; 3, *Coronilla glauca*; 4, *Aspidium filatum*.—*J. Fern*. *Acacia lobata*.—*T. and P.* *Daphniphyllum glaucescens*. It may be struck by *haying*.—*E. F.* *Laelia Schroderi*, *Orchid Album*, vol. 1, pl. 2.—*George*, *Sophronitis cernua*.—*M. Simon*. *Odontoglossum blandum*.—*F. W.* *Adiantum Concinnatum* latum.

NEWLY PLANTED FRUIT TREES IN GRASS LAND, HIGHFIELD: Remove the turf from about the roots, and replace it with a mulching of half-decayed manure over the roots.

ODONTOGLOSSUM ROSSI MAJUS: *G. W.* A very good form, large and well coloured.

PEACH HOUSES: *H. B. P.* If the lean-to house be 10 feet high at the back, and it is 10 feet wide, it would accommodate a trellis for the trees of 10 feet in width. It would spring from a point 2 feet from the front wall, and the highest point would be 8 feet from the floor at the back, and distant 2 feet from the back wall. A trellis so placed would give more training area than an arched one, and expose the trees more directly to the light. The back wall at the upper part could be utilised for Strawberries, Kalosanthus, Azaleas, &c., and the lower part would suit Camellias. If fruits are intended to be grown for marketing of the finest quality, one fruit to each square foot of area may be considered a fair amount of space; but one fruit to a square of 9 inches would produce as large fruits as market salesmen care for, the smaller fruits selling better than the very fine large ones. With your 100 feet run of 10 feet trellis well covered in every part with bearing wood, 1100 to 1200 fruits would not be too many. Rabbit-tails and camel-hair pencils are not wanted to fertilise Peach and Vine blossoms, if the treatment of the trees is what it ought to be. Plenty of ventilation, moderately dry air, a moist state of the border, and now and then a smart tap on the trellis, are sufficient for all purposes.

PHALANOPSIS LEAVES: *F. P. Davies*. The appearance on your leaves is very common on Phalopsis. It is generally supposed to be caused by keeping the plants too warm and giving too much water during the resting period, i.e., from November to the middle of March.

POINSETTIA PULCHERRIMA AMATEUR: The plant is a native of Mexico introduced in 1824, we do not know the introducer. There is no cheap book in which an account of the plant is to be found, but it is described in the *Botanical Magazine*, 3493. It is a stove plant put now under Euphorbia.

TULIPS: *T. & T.* We are sorry we are unable to give the reason for your plants "going blind." Evidently it is due to a check to growth, but what produced the check we cannot say.

VINES: *G. A. B.* Examine the border, as a bad state of the roots is probably the cause of the Vines breaking weakly. For this reason derk the border with Thomson's Vine Manure, forcing it in just during the surface.

WELLINGTONIA SEEDING: *Reading*. This is not at all unusual; but not desirable on young trees.

GREAT REDUCTION IN PRICE OF STANDEN'S MANURE

Established Nearly 30 Years. The reduction has been effected through the introduction of increased and improved plant for manufacturing.

It is now generally acknowledged that this highly concentrated Manure exceeds all others in general fertilising properties and staying powers, thus rendering its money value at least double that of any other Manure.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell.

It is consequently particularly adaptable for Amateurs equally with Nurserymen.

Sold in Tins of increased sizes, 6*lb.*, 1*lb.*, 2*s.* 6*d.*, 5*s.* 6*d.*, and 10*s.* 6*d.* each; and in Kegs (Free) at the following greatly reduced prices:—28 *lb.*, 10*s.* 6*d.*; 56 *lb.*, 18*s.*; 112 *lb.*, 32*s.* each.

SOLE MANUFACTURERS: GORRY, SOPER, FOWLER & CO. (LIMITED), LONDON.

Sold by all Nurserymen, Seedsmen, and Florists.

To Nurserymen and Gardeners. PEAT FOR SALE.—Good, Strong Fibrous Peat, Black Fibrous ditto, Light Sandy ditto for Orchids, Azaleas, Rhododendrons, Heath, &c., or for general purposes. Also good yellow gravel for walks, concrete, gravel, screenings, yellow sand, &c. For particulars apply to Mr. J. ASTRIDGE, Blackthorn Lodge, Camberley, Surrey.

SAVES MORE THAN TWICE ITS COST IN LABOUR. NO SMELL. One application will keep the Walks and Drives clear of Weeds for at least Eighteen Months.

Highly commended by the Judges at the Alexandra Palace Rose Show, 1889, after 15 Months' Trial. Awarded a Certificate of Merit by the Scottish Horticultural Association, 1889.

Mr. W. G. HEAL, Crystal Palace, says:—"We were so satisfied with your composition and its price, that we have used it absolutely, and have every confidence in recommending it."

Mr. R. IRWIN LYNCH, Curator, Botanic Gardens, Cambridge, says:—"There can be no question with regard to its efficacy."

Prices:—In 1 and 2 gal. tins, 2*s.* per gal. (tins included). In 5-gal. drums, 1*s.* 6*d.* per gal.; 10 and 15-gal. Drums, 1*s.* 4*d.* per gal. Special quotation for large quantities. Carriage paid on all orders, and upwards.

Used in the proportion of One Gallon to 25 Gallons of Water. TO BE HAD OF ALL NURSERYMEN AND SEEDSMEN. To prevent disappointment, insist upon having the "ACME."

SOLE PROPRIETORS AND MANUFACTURERS. THE AGRI-HORTICULTURAL CHEMICAL COMPANY, Tunbridge, Kent; & Carlton St., Bolton, Lancashire. Agents in Ireland—W. DUFFIN & SONS, 58, Dawson St., Dublin; WALTER CRAWFORD & SONS, 21, Becher's Walk, Dublin; ALEX. JACKSON & SONS, 55, Broad Avenue, Belfast; McKENZIE & SONS, Limited, Agricultural House, Cornhill Quay, Cork.

New Pattern Tree Guard, "THE PORCUPINE."

The maximum of utility and the minimum of cost. Constructed of strong Iron Uprights and Galvanized Barbed Steel Wire.

Price, 10s. 6d. each.

TESTIMONIALS.

The Gardens, The Whittiers, Kingston, Feb. 9, 1888.
Dear Sirs,—The 100 Barbed Wire Tree Protectors you sent to Mr. Green's order I have now fixed to the trees, and I feel bound to say that I never saw anything in the shape of a tree-protector equal to them. I think I shall be able to add further testimony after the cattle are turned out in the spring.

Yours faithfully, J. WEARING.
The Gardens, The Whittiers, Kingston, Sept. 26, 1888.
Gentlemen,—The 100 Porcupine Tree Guards you supplied to Mr. Green's order have proved a great success—in fact, they are the best I ever saw. These guards stand well against the trees, therefore will not attempt to reach the branches. I would strongly recommend anyone who contemplates planting trees, and wishes to know which is the best guard to use, to give pattern "C" a trial.

Yours faithfully, J. WEARING.

Messrs. Hill & Smith

WIRE BASKETS, WIRE TRELLIS.

Conservatories fitted up with Trellis, Flower Stands, Baskets, &c. Master of the Waddesdon Plant Track—one of the most useful articles in a garden. Strained Wire Fencing, Rabbit-proof Wire Fencing, and Galvanized Wire Netting, Awnings and Pleasancies Plain or Ornamentally constructed. Plans and Estimates submitted.

R. HOLLIDAY,
Horticultural, Iron and Wire Works,
BEAUFORT STREET,
CHELSEA, S.W.

THOS. W. ROBINSON.

FRIGIDOMO CANVAS.

PROTECT YOUR PLANTS AND GLASS From Damp, Frost, and Cold Winds.

A perfect non-conductor of heat, keeping, wherever it is applied, an even temperature.

MADE FROM PREPARED HAIR AND WOOL.

To be obtained of all Nurserymen and Seedsmen, or BENJN. EDGINGTON, LONDON BRIDGE, S.E.

NOTE.—The words "FRIGIDOMO" are registered under the Trade Marks Act, and any unauthorised persons using this Mark will be proceeded against.

SANKEY'S GARDEN POTS.

Are used by the leading Horticulturists and largest Nurseries in the World, and acknowledged by all to be the lightest, strongest, best coloured, most perfect shaped and finished pots ever manufactured.

MARKET POTS,

Or Long Toms, are largely used by Market Growers—they are made a greater depth, wider at bottom, and save half an inch in width at top over ordinary pots. Have no rims.

VINE POTS

Are used by the leading Vine Growers throughout the Kingdom, and pronounced unequalled for Vine Culture.

CHRYSANTHEMUM POTS.

Considerably deeper than ordinary—very broad at bottom, almost upright in shape; do not blow over when outside. Like narrow-bottomed pots; give maximum amount of room for nutriment at roots of plants.

CLEMATIS POTS.

OPINION.—Your pots are light and strong, first class colour, shape, and finish. The 'Clematis Pots' gave unqualified satisfaction to ourselves and customers.—Messrs. Wood & Ingram, Huntingdon.

ROSE POTS.

OPINION.—"We beg to say that we are highly satisfied with your Garden Pot; they are well made, light, yet strong, and we like them better than any others we have ever used."—Messrs. Richard Smith & Co., Nurseries, Worcester.

"The Flower Pots you have largely supplied us with are light, strong, and well made, and in every respect highly satisfactory."—Messrs. Dicksons, Ltd., Chester.

"For nearly thirty years I have been using your Garden Pots, and still find them the best and cheapest."—Mr. William Bull, Chelsea.

"We have always found your Pots highly satisfactory. Great improvements last few years in them."—Messrs. Pearson & Sons, Chilwell Nurseries, Nottingham.

Samples and Prices free. Carriage and breakage free on £10. Half carriage on £5. Specialty Orbital Pans and Pots.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.
The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcester-shire.

Farms to Let.
Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.
For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates. Apply for terms. **SPECIALS FREE.** Price 2d. Published Friday for Saturday.

GARDENING APPOINTMENTS.

Mr. G. FANSON, for five years General Foreman at Rousdon, Lyme-Regis, as Gardener to W. A. DUCKWORTH, Esq., Orchard Leigh Park, Frome, Somerset.

Mr. G. PORTS, Junr., until recently of Elmside, Northam, Sussex, as Head Gardener to DAMPIER PALMER, Esq., Heronden Hall, Tenterden, Kent.

Mr. RICHARD MILNER, for the last twelve years Gardener at Sandome Castle, Salop, as Head Gardener to Miss TALBOT, Penrice Castle, Swansea.

Mr. Wm. SMITH, late Foreman at Brookthorpe Park, Dunbar, as Head Gardener to R. OVEY, Esq., Badgemore, Henley-on-Thames.

WANT PLACES.

Letters addressed "Pute Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable to No. 42, DUCKY LANE, to W. RICHARDSON, Esq., unless the number of the Postal Order is in error, and it has been made payable at a particular office, and to that particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST OFFICE MONEY ORDER.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are returned without notice, address, or anything beyond the postmark on an envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—JOHN DOWIE, Spedsmo, 114, Princes Street, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 247 and 249, High Holborn, W.C.

Gardeners, Foresters, and Land Stewards. R. B. LAIRD and SONS can recommend with every confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

Gardeners, Foresters, and Farm Bailiffs. LITTLE and BALLANTYNE, The Queen's Veterinary and Saddlemen, Carlisle, invite correspondence with Landed Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, and FARM BAILIFFS. Their extensive business relations throughout the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gentlemen seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

HEAD GARDENERS.—At the present time I can recommend several highly respectable MEN, of known ability and first-class character.—THOS. BUTCHER, Seed Merchant, Crofton.

TO FLORESTS.—A young Lady seeks situation in either a Florist's and Fruiterer. Good references.—A. BLAKE, 129, Stoke Newington Road, N.

HOLLOWAY'S OINTMENT and PILLS.—Holloway's Ointment.—The soothing properties of these ointments render them well worthy of trial in all diseases of the respiratory organs. In common colds and influenza the Pills, taken internally, and the Ointment rubbed over the chest and throat, are exceedingly efficacious. When influenza is epidemic, this treatment is the easiest, safest, and surest. Holloway's Pills purify the blood, remove all obstacles to its free circulation through the lungs, relieve the engorged air-tubes, and render respiration free, without reducing the strength, irritating the nerves, or depressing the spirits; such are the ready means of saving suffering when anyone is afflicted with colds, coughs, bronchitis, and other chest complaints, or when so many persons are seriously and permanently afflicted in most countries.

THE PATENT "EXCELSIOR" LAWN MOWER.

The Highest Prize at Paris.

The First Prize Silver Medal, Paris Exhibition, 1889.

The Special Diploma of Merit, Glasgow Exhibition, 1888.

Two First Prizes, Liverpool (open to all the World) Trials, 1886.

The Highest Prize in England.

THE PATENT "EXCELSIOR."

THE SIMPLEST AND BEST LAWN MOWER FOR ALL REQUIREMENTS.

HAS NEVER BEEN BEATEN IN OPEN COMPETITION.

The Best and Lightest-running Hand-power Mower in the Market.

The "Excelsior" cuts the closest of any Mower, collects the grass rolls the ground, and leaves the lawn level, with a surface like velvet.

PRICES.

THE PATENT "NEW MODEL" LAWN MOWER.

GUARANTEED TO BE THE LIGHTEST-RUNNING MOWER IN THE WORLD.

The "New Model" is the best and most efficient Mower of its class.

It has been designed principally for Amateurs, and those who do not employ a professional gardener, and is unequalled for very light draft, low cut, and high quality of work.

It is the only Mower made with the following very important advantages, viz.:-

- PATENT ADJUSTABLE BUSHING TO REVOLVING CUTTER.
- PATENT NOISELESS RATCHET, WITHOUT SPRING.
- PATENT ADJUSTABLE GRASS COLLECTING BOX.
- PATENT SCREW CAP TO ADJUSTABLE HANDLE, which effectually prevents its working loose.

(Limited)

RHODODENDRON

QUEEN OF DWARFS.

We have now many hundreds of the above in flower and bud which have not been before; they may be taken from open ground in October, and got into bloom by Christmas, not requiring the care as the Indian Azaleas do. It is of dwarf habit, with small green leaves, bearing masses of large well-expanded snow-white flowers. Will be universally required for early blooms. A plant was awarded a first-class certificate of merit at the Manchester Exhibition last year. Price of nice plants, 3s., 6s., and 10s. each.

I. DAVIES & SON,
NURSERYMEN, ORMSKIRK,
LANCASHIRE.

SAMUEL SHEPPERSON,

Florist and Seedsman, PROSPECT HOUSE, BELPER, DERBYSHIRE.

Begs to inform the readers of this Paper that he is prepared to execute Orders for the following Plants, all of which are of the very finest strains, and can be had, if they have all been grown on the Derbyshire soil, and are hardy and strong. Carriage free. Cash with order. Descriptive LIST, 3d.; free to customers.

CHRYSANTHEMUMS.—Special culture, not a collection of old-fashioned sorts, but the cream only of the best English, French, American, and Japanese raisers, including the very latest novelties. Good well-rooted plants, 12 for 2s.; 25 for 3s. 6d., warranted true to name; 12 varieties, all new of 1888 and 1889, for 4s.

PANSIES.—A great Speciality. Five Silver Cups, and other Prizes. The cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, 12 for 3s.; 25 for 5s. 6d., free. Also Seed, 1s. and 2s. 6d. per pkt.

PHLOX, special culture, the cream only from Downie, Laird & Sons, Kelway, Ware, and other first-class growers. Six fine varieties for 2s.; 12 for 3s., true to name. Strong stools, to bloom in wall.

CARNACTIONS, PICOTEES, and CLOVES.—Strong layers, to bloom well, finest named varieties, 12 distinct colours for 4s.; 25 for 7s. 6d. Also Seed, 1s. and 2s. 6d. per packet.

CANTERBURY BELLS.—Grand new colours and new forms; double and single, telescopes, cup and saucer, and other varieties. 12 plants, to bloom well, 1s. 6d.; 25, 2s. 6d. Also Seed, 6d. and 1s. per packet.

THE BEAUTIFUL PURE WHITE and PINK MALVA MOSCHATA, one of the best hardy border plants in cultivation. Strong, 2-year old plants, 12 for 1s. 6d.; 25 for 2s. 6d.; also Seed, 6d. and 1s. per packet.

HOLLYHOCKS.—Warranted all fine double flowers. Chater's select strain. Strong year old plants to bloom well, 12 varieties, 3s.; 6 varieties, 2s.

POLYANTHUS and PRIMROSE.—Hybrids, splendid mixed colours, latest strain grown, 12 for 1s. 6d.; 25 for 2s. 6d.; 100, 3s., all good blooming plants. Also Seed, 6d. and 1s. per packet.

HYACINTHUS CANDIDANS.—A really fine and strictly hardy white-flowered border plant. Six flowering Bunches for 1s. 6d.; 12 for 2s. 6d.

DELPHINIUMS.—In all the colours found in this deservedly popular class of border plants. Strong plants to bloom well, 6 for 1s. 6d.; 12 for 2s. 6d., free. Also Seed, 6d. and 1s. per packet.

FOXGLOVES.—Gloxinia-flowered. Dean's grand new large spotted, and pure white varieties. 12 for 1s. 6d.; 25, 2s. 6d. Also Seed, 6d. and 1s. per packet.

SWEETLY-SCENTED, PURE SNOW-WHITE PINKS, quite new. 12 for 1s. 6d.; 24 for 2s. 6d.

CARNACTIONS, PICOTEES, and CLOVES.—Strong layers, to bloom well, finest named varieties only, including many new sorts; 12 beautiful varieties for 2s.; 6d., 6 for 1s. 6d., 100, 15s.

RANCY PANSIES.—Unmated, 12 for 1s. 9d.; 25 for 3s.; 100 for 10s. All different and first-class sorts.

THE NEW DOUBLE SCARLET GEM, hardy free bloomer, strong two-year old plants, 12 for 1s. 6d.; 25 for 2s. 6d. Also 6d. and 1s. per packet.

AURICULA (Alpines). A splendid collection. Strong plants to bloom well, most beautiful colours and sweetly-scented, 12 for 3s.; 25 for 5s. 6d. Seed 6d. and 1s. per packet. Also AURICULA, the real old Scotch Dusty Miller, sweetly-scented, 4 for 1s. 6d.; 6 for 2s. 6d.

THREE WHITE GEMS, CAMPANULA PERSICIFOLIA, Single White, Double White, and CORONATA, all quite hardy and unrivalled for cut flowers. 3 for each for 2s.

THREE WHITE HARDY BEAUTIES—PRIMULA (named), distinct and useful for decoration after being cut. **IBERIS COROLLATA,** evergreen, and full of white flowers; **AQUILEIA ALBA,** the largest pure white. 1 each for 1s. 6d.; 2 each for 2s. 6d.

TOMATOS.—The best sorts in cultivation.—See Chiswick Great Tomato Trial. 1s. 6d. per 3 dozen.

TWO GEMS, PRIMULA CORTUSOIDES and PRIMULA CASHMIRIANA.—Gardening papers say it would be difficult to find more beautiful plants for the Rockery. Borders, or Greenhouse than these. 2 each, 1s. 6d.; 4 each, 2s. 6d. Also Primula Sieboldiana, the Queen of Primulas, Goggie's International Prize, 3 distinct varieties named for 2s.

12 HARDY PERENNIAL BORDER PRIMULA (named), distinct and useful for decoration and cutting purposes, 2s.

12 VARIETIES of SHOWY, Free-flowering, and other WINDOW PLANTS (named), for 2s.

NEW STRAWBERRY, NOBLE (Laxton's).—This is, without doubt, the earliest, hardiest, largest, and best Strawberry in cultivation; 12 fruiting plants for 1s. 6d.; 25 for 2s. 6d.; 100 for 7s. 6d.

STRAWBERRY PLANTS.—Selected Crowns for fruiting this year; British Queen, Pauline, Sabreur, Viscountess, H. de Thury, Duke of Edinburgh, King of the Earlies, Sir Henry, Dr. Hogg, President, The Captain, and other new and extra sorts, 3s. per 100.

S. SHEPPERSON, Florist, BELPER.

As a Supplement TO THE GARDENERS' CHRONICLE

FOR Next Week, April 5,

WILL BE Published an Ink Photograph OF LYCASTE SKINNERI, VAR. ALBA.

THE FINGERED CITRON.

THE cultivation of various members of the genus Citrus extends back to periods beyond the purview of authentic history. They have been propagated by seed, they have been budded and grafted, they have been cross-fertilised of set purpose or accidentally, from time immemorial. One consequence of this is, that occasionally the natural rhythm of growth is interfered with, and a disturbance in the ordinary course of events occurs. Why or precisely this happens, we cannot, as a rule, precisely tell; we are obliged to fall back on vague generalities, and appeal to the general causes above referred to. The Fingered Citron, of which we give an illustration at p. 385, is a case in point. It is one of many growing on the same tree in Mr. Hanbury's rich collection of La Mortola, where some twenty or more varieties are cultivated and duly catalogued in the systematic list recently printed. For our illustration we are indebted to the kindness of Lord Justice Fry.

Numerous similar fruits are figured in a delightful book known as Ferrari's *Hesperides*, written in Latin, and published at Rome in 1646. Among them are several cases in which the investing rind is insufficient, so that the carpels, or "quarters" in popular language, protrude. In other cases there is a double row of carpels one within the other, and so we get forms designated as "*alms inclusives*," or as "*felt*." Sometimes the carpels, instead of being all confined in a ring as in an ordinary orange, are separated one from another (or strictly speaking which have never become united), and protrude like fingers or spurs. These are spoken of as "*distortum*" or "*corniculatum*," and to this latter group our Fingered Citron belongs. The "fingers" are sometimes folded one over the other, so that a resemblance to clasped hands is produced. Such a tree was spoken of as most munificent, because it came with both hands full, or even converted the hands into fruit.

Alms inclusives quia ad utrumque manu immixta sunt manus datur in pennis convolvitur, utque magis munificet sit pennis ipsa convolvitur in manus. *Hesperides*, p. 213.

In another very noteworthy book, published by J. C. Volkamer, and issued in 1708 under the title *Nürnbergischeesperides*, are very numerous excellent illustrations of various kinds of Citrus, including many deformed in various manners, as well as figures of the mode of propagation by means of leaf cuttings. The work in question, we may incidentally add, is very remarkable for the numerous figures it gives of the formal Dutch gardens of the period. In fact, the book is a perfect treasure house for the historian of gardening.

The Fingered Citron is known in China as Foshow-kan, or Buddha's hand. In order to gain further information as to any legend connected with this, we put ourselves into communication with Dr. Bonavia, the historian of the genus, and in whose elaborate work just published, and noticed in another column, several figures are given. Dr. Bonavia, on our behalf, kindly consulted Professor de Lacouperie, an eminent Chinese scholar. This gentleman, however, is not aware of any special legend. According to Dr. Lacouperie, the Fingered Citron is not mentioned in the earliest Chinese botanical treatise, of which we will not inflict the title on the reader, but which was published about 290-307 B.C. In the time of Li schi tchen, the author of a celebrated work on Chinese *Materia Medica*, 1552, 1578, the Citron in question was little known, as it was confused with another very different sort, as pointed out in an enlarged thesaurus of botany published in 1708, and commented on by Dr. Breitschneider in his work on the study and value of Chinese botanical works, and in his *Early European Researches into the Flora of China*, p. 143. "The Citrus digitata, or Chirocarpus," continues Dr. Lacouperie, "a variety of the Citrus medica of Loureiro, is now cultivated at Pekin, as well as the Citrus medica cedra, of which it is a variety." It is mentioned also in Martini's *Atlas Sinensis* (1655), p. 30, as "Idoli manum." Pallas, in his *Reisen*, records that he saw a most curious kind of Citron, splitting into twelve finger-like divisions, devoid of pulp and seed, but very fragrant.

Hilferic Friend, who was a missionary in China for many years thus, refers to the Buddha's hand Citron in his *Flowers and Flower Lore*:—"The artists of the Celestial Empire frequently paint the fruit of this plant, and before me I have one of their pictures representing an ancient sage with a Citron in front of him, the projection representing the middle finger being set forth as wanting or curved, because a favourite position for representing Buddha is with his fingers all open save the middle one, which is bent down on the palm of the hand." One such figure, we learn from Dr. Bonavia, is in the British Museum, all the rest showing the hand open, and similar representations in porcelain are by no means uncommon.

Mr. Hanbury kindly writes in reference to this subject, "I would say that the Buddha Fingered Citron grows in the province of Fokien, which is the central seaboard province of China. The fruit was brought up in the winter time from the ports of Foochow and Amoy, and seemed to be highly prized by the natives for decorative purposes. Chinese ladies, it is said, in receiving company (*i.e.* other ladies) will sit in a sort of state with the Buddha Fingered Citron in one hand, and an embroidered pocket handkerchief in the other, which would not be embarrassing as the Chinese do not shake hands. The Citron has a most agreeable scent in China, much more pronounced than those that have fruited here. The trees I have here I got direct from China some years ago, the fruit has

invariably been fingered, but has fallen off in an immature state, the size of a hazel or wall nut. Last year, however, I gave very special orders for tending and watering the plants more carefully, and the result is half-a-dozen fruit fairly matured. I well know the sports in Oranges and Lemons which throw out fingers or mal-formed fruit, but this Buddha Fingered Citron is quite different and persistent. The Buddhist priests are rather clever in devices for convincing sceptics. Thus in the province of Chekiang they take a large fresh water mussel (*Alasmodontia*) and gently attach leaden images of Buddha under the fish, after which it is thrown back into the water. Nacre is deposited over the lead, and after a few months the shells are retaken, cleaned, and then sent abroad to sell as proofs of the power and presence of Buddha. By what device the Buddhist priests have induced the Citron to aid them in convincing unbelievers, as they certainly have the fresh water clam, is a curious point that wants clearing up."

All these cases of Fingered Citrons come under the head of that separation (or want of union), which is technically called dialysis of the carpels (fruit quarters)—Masters' *Vegetable Teratology*, p. 75, &c. Sometimes this is associated with the presence of a second whorl of carpels above and within the first, as already mentioned; or sometimes outside, as shown in a figure in Lindley's *Vegetable Kingdom*, p. 45.

Dr. Bonavia, as elsewhere mentioned, holds the opinion that the peel, which covers the carpels, consists in reality of a row of modified or abortive carpels, but this is a view which, as at present advised, we cannot share.

We may add, for the benefit of those who may be disposed to make further enquiries on this subject, that they will find figures and descriptions of the normal and abnormal structure in the genus Citrus in Gallesio, *Traité du Citrus* (1811), Risso et Poiteau; *Histoire et Culture des Orangers*, nouvelle édition, par du Breuil, Paris (1872); and specially in Penzig's elaborate treatise, *Stuhl Botanica sugli Agrumi*, &c., with an atlas of plates (1887); see especially tab. 8, 9, and 10. Penzig also gives a very full bibliography of all that concerns his subject. It would occupy several columns merely to cite the titles of the works alluded to.

Our illustrations show Mr. Hanbury's Fingered Citron, from a drawing by Miss Fry (fig. 59), the Kumquat (fig. 58), with sections showing the structure of the flower and the disc below the ovary which De Candolle, the elder, considered as becoming the rind of the fruit, a view not supported by modern anatomical research; an Orange with supernumerary carpels, and one received from M. Naudin, in which the rind showed several projections arranged spirally, as if of foliar nature (figs. 59, 60).

COLONIAL NOTES.

TRINIDAD.—After having for many years cultivated plants in different temperatures by artificial means in England, my lot fell to cultivate them by the same means in the cold climate of North America, and afterwards for many years, and to the present time, in two of the largest West Indian Islands.

I well remember how empirical and arbitrary were the rules adopted by the "rule-of-thumb;" men of my earlier days, each one of whom insisted that his own way was the best, but many, though pursuing different systems, *i.e.* apparently so to them, arrived at the same result, simply because an essential

condition overlooked by all was present in each operator's method.

The essence of this empiricism seems to be that no knowledge of the conditions that existed naturally in the habitat of a plant, is of the same value from a cultivator's point of view, as that obtained by actually attempting to grow the plant under the various conditions existing in our modern horticultural structures.

It is quite true that plants often appear to exist under quite different conditions to those generally known (or conceived), of their natural habitat, but an examination in full, and an accurate knowledge thus obtained of each of these conditions, generally proves that the essential point is there, or the plant will not thrive.

One of your correspondents illustrates his argument by relating that many an Orchid quite at home on the branch of a tree in its native home, will not thrive in cultivation unless placed in peat and moss in a basket or pan. Why it is so he does not state, but merely gives the empirical "it won't do!" Why does he not tell us the reason? If he had sought it he would probably have found that the arid atmosphere of his stoves at times was such that it was impossible for the roots to exist, and therefore unless covered with peat and moss, which gave them the best imitation possible of the air of their native home, growth was impossible. A condition therefore unobserved by the operator was present in both places. Mr. Watson prominently expresses the surprise of Mr. Morris to find so many of the West Indian Filices growing in a cool temperature. I am inclined to think such astonishment is "more apparent" in Mr. Watson's mind "than real" in Mr. Morris', for it is well-known to him (Mr. Morris), and to the writer, that these West Indian Filices are quite at home under cool treatment, the thermometer falling in their native home to below freezing-point at times. I fancy Mr. Watson would not have so good a record were he to try to grow Filices from the lowland West Indies, where a mean annual temperature of 78° to 80° Fahr. prevails.

The pretty *Lælia monophylla*, found in Jamaica has, it may be said, a climate of its own, for it is only found in situations identical as regards elevation, temperature, and the greatest similarity between the humidity of the places. At p. 139, *Gardeners Chronicle*, this plant is described as succeeding well in the Odontoglossum-house, and that is just the temperature and conditions which I prescribed for growing the plant in your columns, after collecting it in its natural habitat, three or four years ago. The little *Epidendrum serrulatum* growing on Coffee trees at 5000 feet in Jamaica, is seldom found below that elevation in that island, while in others nearer the equator, and possessing a greater humidity, it is found at sea-level. Difference of temperature, 17° to 25° Fahr.; difference in humidity, *nil*. Is not the inference plain? We do not overlook the fact that, with the absence of sunlight, plants require somewhat different treatment, but this is only an artificial condition, and does not in any way affect the main argument.

Anyone living in Jamaica, as I did for years, was apt to conceive the idea that many of the European and American Conifers would not thrive at or about sea-level in the West Indies, as it was simply an impossibility, under any conditions, to get them to thrive on the south side of the island at sea-level, and only on the hills could they be grown with any degree of success.

In Trinidad, on the contrary, the Coniferae thrive fairly well, and attain a large size at sea-level; the temperature differs at most by 1° between the two islands, but the state of the atmosphere is far more humid. What, I would ask, is the inference?

Take *Broughtonia sanguinea*, which grows and thrives well at sea-level, on bare trunks, well exposed in Jamaica, but in Trinidad utterly refuses to thrive unless kept in a position the driest obtainable. Temperature and position, again, almost the same, humidity differing.

Again, Mr. Watson wonders why we cannot keep seeds here, while he never fails to keep them in a drawer in an office whose "temperature is 60° Fah.," but of which the humidity is not stated. We cannot keep them, and three years' trial in Trinidad proves conclusively that it is humidity not temperature that affects seeds, and destroys them.

Happy-go-lucky descriptions of temperatures of places from which plants are obtained are, I admit, of little or no value, but I cannot believe that a record of temperature, rainfall, humidity, weight of atmospheric air, density of vapour, or, in total, the atmospherical conditions of a given part of the world's surface are of "little value" to the cultivator.

Outside conditions, to my thinking, have more actual effect on the evolution of plants than have mere accident of position, soil, or cultivation, and I do not believe Mr. Dyer meant to under-rate their influence upon plant growth in preference for the empirical, and trial by circumstances, and cultivation of the English horticulturist.

Roupellia grata is known in the Jamaica Gardens

influences would give the cultivator a much surer hint, and put him in a more direct road than the innumerable trials he will otherwise have to make.

Gardeners, as a rule, make a great point of plants in cultivation being much better grown than those left to Nature. Why, surely so, no one would expect anything else—and why? Simply because if left to Nature, they have to maintain their own struggle for existence against man, animals, climatic influences, insects, and fungoid or other enemies; while in cultivation, once the routine is ascertained, the gardener's duty is not done, unless he rids them of all these beneficial influences. But though they may be considered well grown, is it a fact that they are so? even with all the care given, for we find even the best grown and first prize decorative other plants seldom produce mature seeds as they would do in a state of Nature, thus showing that they are practically inferior—though perhaps better looking.

Knowing the outside conditions well, also points out the road where the observant horticulturist may attempt a modification with benefit in his artificia.

it, seeks to prove that man can find out methods more suitable than the natural method of Nature for the growth of plants, but this I cannot believe; neither can I think Mr. Dyer intended to convey such an impression. What I do believe is, that a due attention to all the conditions present in Nature, and an imitation of those "most essential by the best artificial means in our power," is by far the surest mode to the successful cultivation of plants out of their natural habitat. *J. H. Hart, F.L.S., Superintendent, Botanical Department, Trinidad.* [Mr. Hart's observations are so valuable that we have felt it right to insert them, although we deprecate, for the present, the continuation of the discussion, on the part of "home-growers." New facts or illustrations are at all times welcome. Ed.]

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT LANGLEY PARK.

At Mr. C. Goodheart's garden, Langley Park, Beckenham, amongst other *Cypripedia* in fine order were *Cypripedium caudatum* roseum carrying six blooms, *C. niveum*, *C. hirsutissimum*, *C. bellatulum*, *C. concolor*, &c. Suspended from the roof of the *Cypripedium*-house was a plant of *Oncidium sarcodes*, with two spikes, and about 300 bloom-buds. The stage on which the *Cypripediums* stand is constructed to carry an inch of water, which may be drained off at will. In another house containing *Odontoglossums*, were plants of *Cymbidium Lowianum*, one with thirteen spikes. These plants were bought at Messrs. Protheroe & Morris' Rooms, three years ago, for 2s. 6d. each. They have since been sold for 30 and 28 guineas respectively, having outgrown the space that could be afforded them. One of the plants threw up thirteen spikes last autumn, which were taken off by the fog. Mr. Padbury, the gardener, kept the plant dry, and it again threw up thirteen more spikes. The plants were grown in peat, loam, and charcoal, in a low house. *T. W.*

ORCHIDS AT STUDLEY HOUSE.

Among the many handsome varieties of *Cattleya Trianae* which have bloomed this year in the well-grown collection of F. G. Tautz, Esq., Studley House, Shepherd's Bush, that known as *Cattleya Trianae Tautziana* maintains its reputation as being one of the best. It is now in perfect condition, its exquisitely formed labellum exhibiting that glowing crimson which can only be likened to the same as seen in *Cattleya Hardyana*. Its flowers are of fine substance, the sepals and petals of a warm rose tint, the petals exhibiting a narrow but well-defined feathering of crimson running up the mid-ribs. There are larger-flowered *C. Trianae*s, but nothing more beautiful than this can be desired; one of its striking features is the evenly crimped edge which the lip has.

A good show is made with the varieties of *Dendrobium nobile*, *D. Wardianum*, *D. crassinode*, *D. Ainsworthii*, *D. chrysothoax*, and other *Dendrobies*, and the richly-coloured and variously-tinted forms of *Lycaste Skinneri*, of which the collection boasts some fine examples of the finest pure white variety. *Lycaste cruenta* was also profusely in bloom, and all the *Lycastes* in the little house set apart for them have very stout growths. They are potted in what seems to be an ordinary loamy soil, such as is used generally for bulbous plants, but with a little peat and sphagnum moss added. The *Cypripediums* and *Calanthes*, *Phaius*, *Cymbidiums*, and such things, are especially good, and for these Mr. Cowley uses a more retentive potting material than is used by some growers, and the large size and substance of the foliage, with the fine quality of the blooms, bear witness to the propriety of the course.

Among the *Cypripediums* at present in bloom are the rare and beautifully striped *C. Dauthieri* mar-moratum (illustrated from the same plant in these columns), *C. Petrei*, *C. Swainianum* × *C. callosum*, *C. selligerum majus* × *C. selligerum rubrum* × *C. leucorhodum* ×, and *C. Sed-dent candidulum* ×, both charming delicately tinted varieties. *C. Druryi*, *C.*

FIG. 56.—FINGERED CITRON, GROWN IN MR. LANGLEY'S GARDEN AT MENTONE, 1884. (SEE P. 383.)

as a flowering shrub 4 to 5 feet high, producing abundance of flowers. In Trinidad this plant seldom flowers at all, and instead of a shrub becomes a climbing plant 20 to 30 feet in height. Take our plant to Jamaica, and the Jamaica plant to Trinidad, and the conditions of growth will be altered, and the very form and shape of the plant and its habit of growth in twelve months. Aye! even take the same plant, and change it from place to place, and I would venture to say that the same result would ensue, because the outside conditions totally differ in essentials. The soil is by no means so important an agent in the cultivation of plants as it is generally supposed to be, and should only be considered as a medium or means to an end. The reason why (in instances quoted) plants have not been found to thrive in the same soil as that found in their own habitat, is—to my mind—because the medium "is insufficient to secure under the changed conditions of artificial cultivation, the outside or external conditions, necessary to the plant's welfare," and consequently in gardening practice other mediums are sought for and found probably after many generations of the imported plant has been unsuccessfully cultivated, but certainly a knowledge of the outside

course, and thus assist Nature instead of endeavouring to control her, as empiricism teaches. We are not unaware of the ubiquitous nature of some plants. To some, it appears a matter of indifference whether the climate is cold or hot, dry or moist; but even in these, close observation proves that their particular structure enables them to bear, with impunity, changes, which would be death to the majority of plants.

It is a particular craze for people (especially Europeans and Americans) to try to grow the flowers and plants of a temperate climate in the Tropics, and many thousands of times have I (I fear in vain), answered the question as to the reason they won't thrive, by asking the following: "Would you expect Pine-apples in the Arctic regions?" People ignorant of horticulture, ignorant of botany, and vegetable physiology, although perhaps well read and even learned in other things, are apt to ask these questions, so obviously ridiculous to the botanist, but still requiring to be answered for the satisfaction of the ignorant. Did they but have any idea of the various conditions which are essential to individual plants, and a thorough knowledge of the climate from which each plant comes, such questions would not be asked, for it would be manifest to any ordinary mind that to ask them would be absurd.

The argument of a Gardeners' Problem, as I see

Mrs. Chas. Canham's, *C. politum* × *C. Lawrenceanum*, *C. argus*, *C. callosum*, *C. calophyllum* × *C. caudatum*, *C. Rothschildianum*, several forms of *C. barbatum*, and others; the *C. niveum*, *C. Godefroyi*, and *C. bellatulum* section having many specimens in bud. All these *Cypripediums* are large specimens, and most of them have many flowers.

The *Odontoglossum*-house was gay with sprays of *O. crispum*, *O. Pescatorei*, some fine forms of *O. triumphans*, a spray of the rich violet *O. Edwardii*, a fine form of *O. polyanthum*, the true *O. navium majus*, and a handsome variety of *O. blandum*, some good forms of *O. Rossii majus* and *O. Cervantesii*, *Sophranitis grandiflora*, and *Oncidium cucullatum*, &c.

In the other houses were a noble specimen of the fine *Cymbidium eburneum*, with eighteen flowers open and more coming on; the rare *C. albuciforme*, and some large *C. Lowianum* in bud; the singular *Gongora truncata*, the rose-lipped *Aerides Houlettianum*, the singular and fragrant *Ornithochloas grandiflorus*, *Oncidium Leitzi*, *Angreum citratum* and *A. Leonis*; several fine *Oncidium ampliatum majus*, various *Celogynes*, *Epidendrum Wallisii*, and a number of lesser things which would not fail to interest the visitor. At Studley House the large stock of *Miltonia vexillaria* is now, as usual, in fine condition, and sending up spikes in profusion; the white varieties are well represented, and the richly coloured *M. v. superba* is now a sturdy plant with several leading growths.

PHALANOPSIS SCHLEIFERIANA COMPACTA NANA.

Apropos of your N. York correspondent's description in your last issue, of Mr. Frederick Scholes' grand plant of the above, it may not be inopportune to draw attention to the fact, that the specimen in question is one of the two described and figured in your issues of January 28 and April 28, 1888, as extraordinary fine plants of the Butterfly Orchid. I have recently been informed by the manager (my brother, who has been in the same capacity for nearly twenty years past) of Mr. Scholes' establishment, and as grower of the Orchids, that last season he considered it to be almost impossible to eclipse the then floriferousness of the specimen indicated, with its only about half the number of its expanded flowers, in comparison with the wonderful number of the present season. The *Phaleopsis* appear to be a specialty with Mr. Scholes, considering the very large number of plants of this section he possesses amongst this vast collection of other kinds, and not least among which is the great proportion of *Cypripediums*.

I may also add that the winter forcing of *Tea Rossii* is also fostered to a considerable extent by Mr. Scholes, and that the liquid cow-dung—so successfully applied to those Orchids requiring it—forms an important factor in the cultivation of the *Rossii*. *W. Gardner, Harborne, Birmingham.*

THE HIPPEASTRUM.

I WAS unable to be present to hear the reading of Mr. Veitch's paper on the above subject, on March 11, at the Drill Hall. In my own paper, which was not read, the historical part was lightly touched, but the subject is of some importance, as we are probably more indebted to some of those early-introduced species for some of the more hardy garden hybrids than may generally be supposed. In the re-marks at p. 329, the variety *Empress of India* is mentioned, but the raiser's name is not given, and it is but fair to an excellent cultivator, M. S. A. de Graaff, of Leyden, to say that it was raised by him in that city. M. de Graaff's plant may well be included in any historical sketch of this genus. I am informed that the *Hippeastrum* has been cultivated in Leyden since 1790. *H. regina*, *H. vittatum*, *H. striatifolium*, and *H. advenum*, had been introduced at that time, and a grand-uncle of M. de Graaff's cultivated them, and raised seedlings. M. de Graaff's father began to cultivate and improve the plants in 1839; he obtained *John-oni*, or *Herbert's Regio-*

vittatum, a well-known variety, raised by a shoe-maker named Johnson, in 1810, and by Dean Herbert, at Mitcham, in 1811. Herbert's system of naming was to unite the two specific names; the variety in question was produced by crossing *H. regium* and *H. vittatum*. Mr. Johnson supposed the plant in question to be a cross between *Sprekelia formosissima* and *H. vittatum*; he was doubtless in error. This hybrid, therefore, with fulgidum and croceum was the basis of the elder M. de Graaff's work, and it is stated that he obtained many fine varieties with rich and deep colours. The present worthy head of the Leyden establishment took up the work about 1862, and with the material handed down to him obtained wonderful results. He introduced *H. psittacinum*, also Brazilian; and he crossed again for size. He obtained fine waxy-white varieties, and the deepest scarlet and crimson colours; also many with delightful pale tinted flowers. *Empress of India* was the result of crossing a dark seedling from *H. psittacinum*, with a seedling named *Graaveana*, raised in the establishment—not the French *Graaveana*. These two were crossed both ways, and it could not be determined which was the seed, and which the pollen parent. I had the pleasure of inspecting M. de Graaff's plants two years ago, and must say that I never saw better cultivation anywhere; there did not seem to be a single weakly plant amongst them. From want of room his seedlings take longer to flower than they would if they could be grown on rapidly from the first.

The de Graaff strain takes from four to six years to grow into a flowering size; the *Leopoldii* and *parvum* strain take about two years. The plants, after they have flowered, have the pots in which they are growing plunged over the rims in tan, which is preferred to any other plunging material. If the foliage has not decayed by November, it is cut clean off, and the pots, with the bulbs, are arranged on bulb shelves. They are taken down and repotted about the middle of February, but M. de Graaff says he would rather repeat them in January, his only reason for deferring the operation being that the house is not ready for them. They come on all the more rapidly from being late planted, as they are in flower in four to six weeks afterwards. The good work done in Messrs. Veitch's nursery at Chelsea is well known from their seedlings being so frequently exhibited in London, where they have received the awards their great merits deserve. Messrs. Kelway, of Langport, Somerset, have been cultivating *Hippeastrums* for seventeen years on a system of their own, and they have at present about 20,000. In a letter written to me by Mr. James Kelway on January 29, he says:—

"We are now commencing to plant our seedlings and offsets in cold span-roofed frames; these are 9 feet wide with wooden sides and ends. The frames are placed on the ordinary soil in an open situation; it is made rich by old hot-bed manure, and a good dressing of yellow sand to keep the soil open. The bulbs are planted from 2 to 4 inches deep according to size. The drills are from 6 to 9 inches apart, and the bulbs are planted from 3 to 6 inches asunder in the drills. They remain in the frames for two or three years, until the plants have grown to a size large enough to bloom."

Of course, they would not be all large enough, therefore a selection has to be made. The smaller bulbs are planted out in the frames again, and the larger ones are planted in pots or sold. When the bulbs are potted up for flowering, instead of placing them in a hothouse, Messrs. Kelway place them back again in cold frames, where they are plunged in the same way as *Hyacinths* and other hardy things, they commence throwing up their flower spikes and foliage in April, and produce their flowers in May; indeed, flowers are produced all through the summer months. They receive no artificial heat whatever; but are carefully protected from severe frost by a covering of hay inside the frames, and ordinary mats outside. It is added, that the plants grow most luxuriantly,

and generally retain their foliage until the end of the season. This system of culture adopted at the Langport nurseries could not, perhaps, be adopted with the strains we cultivate in our hothouses, and the strain grown has evidently been obtained by seeding from hardy species or varieties. Some of the best of them have been exhibited in London; they are rich and varied in colour, and must be well adapted for greenhouse and conservatory decoration; the flowers have not the large size and rounded form of Messrs. Veitch and de Graaff's strain; the petals are more pointed, but by some they are preferred as being more elegant.

As I write these lines (March 20), our plants, which were potted early in January, are just coming into bloom; and we wanted them to be at their best by March 27, and probably they will be. My plan is to start them in a rather low temperature; Mr. de Graaff says his are started in 60°—that would probably be the mean temperature. Our house is kept at a minimum of 45° to 50°, rising from 5° to 10° more by day. This is for the first three weeks or so; afterwards the temperature would be advanced 5°. An important point is to see that no water is applied to the roots for a month at least; and, to prevent decay, the atmosphere is not rendered very moist. When the plants are well started, the flower-spikes coming up freely, and leaves are formed, they require water. We never at any time give manure-water. The potting soil is well enriched with manure, sufficiently so to sustain the plants well until flowering period is passed, and the pots are then plunged so deeply in the tan-bed that the roots push over the rims, and revel in the tan more than they do in any kind of loam, peat, or leaf-mould. *J. Douglas.*

THE PRESERVATION OF SMALL BIRDS, ETC.

IN the case of large trees or neglected orchards, Mr. Hiams, speaking at the recent Fur Conference at Evesham, and reported in the *Evesham Journal* said he was afraid nothing could be done till next autumn, except to rigidly encourage and preserve all useful insectivorous birds. Every nest robbed or destroyed relieved the birds from the industrious task of picking at least 5000 caterpillars to maintain a brood. With respect to the value of small birds, as caterpillar destroyers, many birds might be encouraged to take up their abode in gardens and orchards if any accommodation were provided for them. He then exhibited a little box, which he said would have been inhabited that night, only he had brought it there to show them; and he also exhibited a drawing by Harrison Weir of the same box and its inhabitants. The lecturer also alluded to many ways in which homes might be provided for the birds, and added that he had as many as forty-four habitations regularly occupied in his garden and orchard some years ago.

With regard to the valuable birds, he had the greatest confidence in recommending a list of most useful aids in orchards and gardens, both as caterpillar and moth destroyers. First on the list he would put their old familiar red breast. Although master cock robin was fond of a little fruit, he was also fond of caterpillars, grubs, earwigs, and no doubt, taking all round, he did a great deal of good. Robins could be induced to take up their abode and to rear their broods almost to order in artificial homes put up for their occupation. To some this might seem a ridiculous idea, but those who took an interest in this kind of thing would know that it paid. The hedge sparrow was a perfectly innocent bird, and never touched the most tempting fruit; but, on the other hand, they were most useful destroyers of insect pests. They also could be encouraged to occupy any abode if a few faggots or kids were placed in an orchard for their accommodation. Redstarts also were quite harmless, and fed exclusively on flies, caterpillars, and such food. These birds should be induced to build in or about orchards, and were easily tempted to do so if anything of a suitable size to fix a nest in, such as a Tomato tin, were provided. Fly-catchers were ex-

clusively insect-catchers, and destroyed vast quantities of moths and butterflies for their young. These birds also could be very easily induced to take up their homes in artificial abodes, such as an old trap or tea-kettle. The wren tribe, of which there are five species, were quite harmless and exclusively insectivorous, and should be protected to the utmost. The common wren could be induced to build in boxes. The willow wren was found in orchards and gardens, and was very useful in taking caterpillars. He had watched a little willow wren, and had seen it take eighteen grubs out of buds in fifteen minutes. And these wrens could be induced to take up their abode in places provided for them, and they fed exclusively on insects and caterpillars.

Then they came to the tit family, and he thought that the gardener had no better friend than the common blue tit. Many people would say that they pecked at the fruit before it was ripe, and that they were very fond of green Peas, and would also take bees. It was said that they would tap the bottom of a hive to get the bees to come out, and would then attack them and take them home. He had never seen that done, but he knew that they took the bees which had died, and had been carried outside the hive. On the other side, he was a really caterpillar hunter in the summer, and destroyed a large quantity to raise his family. They could be easily induced to take up their abodes, and could be destroyed or preserved at pleasure. There were other kinds of tits which only varied a little as to their usefulness. The long-tailed tit was, perhaps, the most useful, and was quite innocent, living almost entirely on aphides and insect eggs. The small blue tit was another, and this lived on aphides in the summer, but was partial to a little fruit in the autumn. The coal and marsh tits were also useful insect destroyers, and could easily be induced to build in artificial homes. The murrelet was also a useful caterpillar destroyer. The woodpecker family, of which they had four species, were useful in taking insect food from the trunks and boughs of trees. Starlings were very valuable in taking large quantities of caterpillars, and were easily induced to occupy homes in orchards and gardens.

Another family of birds also useful in and about fruit plantations, were the warblers. The garden warbler, black cap, white throat, and nightingale were all caterpillar destroyers; the black-cap, which was often mistaken for the nightingale, being very fond of the aphides from Plum and Apple trees, while the garden warbler was partial to the black eggs on Cherry trees, which, as far as he knew, were not attacked by any other bird. Then they came to a list of a mixed nature, with good and bad qualities. Such were the house-sparrow, pie-finch, and yellow-hammer, all partially caterpillar destroyers. He expected they found the pie-finch, and also the green-finch or green linnnet, very destructive to the young Radishes. The bull-finch and green-finch had black characters; some said they only attacked buds which contained insects, but that was all nonsense, as he had proved. The hawk-finch, of which Mr. Hians produced a specimen, was very destructive to Peas, and had a bill so strong that he could crack Plumstones as easily as a man could crack a Nut.

EXPERIMENTS ON LORD SUDLEY'S FRUIT FARMS.

In the first place, to come to the point at once, he would take the Evesham or winter moth. As they all knew, of course, the female moth which laid the eggs was wingless, and that it was necessary for her to ascend the stem of the tree. One thing they had to decide was, the right time to put the bands on if they put them on at all, and how long should they be kept sticky—should they be fixed on October 1, or November 1, or when? They found by comparing notes for the past three years at Toddington, that the bands should not be put on later than the first week in October. In 1888 they commenced banding on October 16, and caught the first moth on October 18; that was too late, and it showed that the moth might be earlier or later according to

the season. This year they caught the first moth on October 7; that showed that the bands should not be put on later than the first week in October. This winter they were catching moths on the bands at Toddington on December 16, and that showed that to catch the first hatch the bands should be kept sticky until December 31. With regard to the grease, in 1887 they used a ready-made mixture, and in 1888 they made their own stuff, which was composed of 1 gal. of Stockholm tar to 1 cwt. of grease, and they also used ordinary car grease. They found without doubt that all these mixtures were injurious to the young trees, and in fact none of their trees were more than ten years old, and many only three or two years, so they determined not to use them again. He had found trees alive up to the band and dead above it, and he thought that was pretty good proof.

There was no doubt that the tar formed a sort of hard band round the tree and stopped the flow of the sap, and water-proofed the cells. It was also a question whether it would not soak into the bark, and become distributed into the sap. When the trees had resisted the grease he found the bark cracked and peeled off, so that if another band were put on in the same place it would no doubt greatly injure the tree, if not kill it; if it were put lower down, it would be extremely dangerous. Then again, grease was sure to soak into the bark of a young tree to a great extent. The tar no doubt did the mischief. Taking all that into consideration, they determined to put a band of paper on the trees, and the grease on that, and he showed specimens. The paper cost about 10s. a cwt.; it was grease-proof paper, and it was procured from Messrs. Adlard & Evans. The paper was ready cut to put on the trees, and one ream would do 247 trees, one sheet would do six trees, and 1 lb. of grease would do six trees. The work was chiefly done by women and boys. One woman with a basket and a pot of paste, wrapped the paper round the tree, and pasted the lap, and was followed by one who tied a piece of matting round the lower end of the band and could also grease it; in this way, two good women could do 200 trees a day. He thought that the grease should be renewed every three weeks or so, and the bands should be kept sticky at least up till Christmas; he found a moth on December 17th last year. Now they came to the question as to how, having taken all that trouble, they found caterpillars in the spring. One way in which they were beaten was that the male moth carried the female up into the tree and deposited her in the branches. Another point to consider was, were the eggs laid in stems of the trees below the grease band fertile? He found some eggs last spring, and they sent some to Miss Ormerod and asked whether they were fertile, and in her reply she said the eggs appeared alive in many instances. In consequence of what Miss Ormerod said, they got some hard scrubbing brushes and scrubbed each tree with a mixture of tempered clay, soot, lime, cow-dung, and water, and they would do the same again in the spring; not only did it destroy the eggs, but it had a beneficial effect on the trees in cleaning the bark.

KEROSENE EMISSIONS.

Mr. Fletcher, the Dominion Entomologist of Canada, in a letter to Capt. Corbett, recommended kerosene emulsion to be applied at the end of March. The emulsion should be made of various strengths, according to the age of the tree. The following was the ordinary strength:—One pint of kerosene (or refined coal oil), half ounce of common soap, half pint of rain water; the soap to be boiled in the water till all was dissolved, and the kerosene to be churned up in it. If these were used for spraying, they must add nine times the quantity of water. They found that in pruning young trees, a great quantity of eggs were destroyed, but the prunings should not be left about the gardens, or else the eggs would hatch. They took them all away and burnt them. They then came to the question of greasing in the spring, to catch late comers. Last year they greased on March 2, in case any cater-

pillars should hatch in the Currant bushes and find their way up the Plum trees, but they caught very few. He did not think it paid to do, but should be glad to hear some practical opinion on the point.

As regarded the caterpillar when it hatched, supposing they had not greased, and their trees were covered with them, what was to be done? Shaking was not much good, if they had bush fruits under. They tried that in a plantation that was badly attacked, but they shook them on to a sheet and caught thousands, and they shook them on to the black Currants, and they attacked them, and they even tackled the Strawberries. If there were grass underneath the trees, shaking might be useful. The caterpillar, immediately on hatching, ate its way into the nearest bud, and there remained until the bud opened, by which time it had grown considerably. The time to kill by washing was when it first hatched, but the difficulty was to catch it at the right moment. What they wanted was a wash that would kill it after the leaves were out. They had tried everything they could think of; they had tried paraffin and soft-soap, but with paraffin care was necessary. They used 1 pint to 3 gallons of water as an experiment, and killed the tree; but he thought the reason the tree was killed was because the paraffin was not properly mixed with the water. No doubt several solutions would kill the caterpillar if they could get at it. They had tried 2 oz. of soft soap boiled in 1 gallon of water, and a quarter of a pint of paraffin added, and they found that if they held a branch in it the caterpillars were killed; but syringing a tree with it did very little good apparently. Common soda was tried, first 14 oz. to 3 gallons of water; this killed the caterpillars, but shrivelled up all the leaves and fruit. Then they tried 8 oz. to 3 gallons of water, which slightly burnt the foliage, but did not kill the caterpillars. But then the caterpillars were nearly full grown, and what the result would have been had it been tried before he could not say. They had also tried other things. Mr. Fletcher had written a letter to Captain Corbett, in which he stated that he was under the impression that the most satisfactory mode of treatment would be to spray about the tree with some preparation of arsenic.

USE OF PARIS GREEN.

For his part he preferred Paris Green as being the most uniform in quality. The chief thing to be guarded against was getting the liquid too strong. He went on to express his opinion that the only successful treatment was spraying on the trees just when the caterpillar was hatched. Fumigation was also recommended. Mr. Wise mentioned that last spring they were burning a road through one of the largest plantations, and there they had a very large crop of fruit indeed. Spraying should, he thought, be done between April 14 and 30, and if done then he did not think any fear need be occasioned by the use of Paris Green where they had Currants, Raspberries, Gooseberries, or Strawberries, as these fruits would not have advanced enough to be contaminated, but in the case of vegetables it was a different matter. Miss Ormerod pointed out that the proportion of arsenic would be so minute—only about 1 oz. in 40 gallons of water—to an area of about 1 acre of flat leafage, that it seemed to her impossible that any ill results could arise from the poisonous nature of the application to human health.

NEW USES FOR COTTON-SEED OIL.

It is well known that the oil from Cotton-seed is now an article of very large consumption, both in America as well as in this country, and that when clarified and refined, it comes into our markets as pure Olive oil. Cotton-seed oil is a pure, sweet vegetable oil, and if sold as such, there is nothing to be said against it, but there is much to be said against the practice of giving it a name which does not properly apply to it, and thus obtaining for it a higher price than it would otherwise realise.

As a culinary oil, then, whether under its own name, or under that of another plant, Cotton-seed has established a reputation. The latest develop-

ment, however, is in the preparation of another household article, namely, lard; for under the name of Cotton-seed lard, the oil is now being much used in America. Samples of this lard were exhibited in the American division of the late Paris Exhibition, and, as there shown, consisted of a pale straw-yellow coloured substance of a similar consistency with ordinary lard, possessing, according to the manufacturer's statements, many advantages of hog's lard, some of which are, that it prevents or even cures dyspepsia, in assisting digestion; that it emits no disagreeable odour in cooking, and leaves no taste in food cooked with it or made from it; and, lastly, it is claimed that a great trade is expected with it amongst Hebrews, who can have no objection to its use. The composition of this so-called lard, however, is not of Cotton oil alone, but, as stated, "simply from the highest obtainable grade of the oil of the Cotton-seed and beef suet; nothing else." This preparation obtained a Gold Medal at the Paris Exhibition, and the American company who have started its manufacture are now advertising laundry, bath, and toilet soaps and soap-powder from pure Cotton oil. Are these preparations intended to displace Peas?

NEW OR NOTEWORTHY PLANTS.

PHAEUS COOKSONI, n. hybr.⁸ (fig. 57, p. 389).

THIS is a new and handsome hybrid, raised by Norman C. Cookson, Esq., of Oakwood, Wylam-on-Tyne, between Phaeus Wallichii, Lindl., and P. tuberculatus, Blume, the former being the seed-parent. A fine raceme and leaf have just been received at Kew, with the following particulars:—The plant was fertilised in February, 1887, and the seed ripened, and was sown in the following December. It will thus be seen that the plants have reached the flowering stage in but little over two years, an unusually short period. The seedlings are said to be in most respects intermediate, the pseudobulbs being more elongated and lighter in colour than the mother-plant, but the general habit is more like this than P. tuberculatus. The leaf is quite intermediate, but in the lighter colour takes somewhat after the last-named plant. It is said to be very robust. The raceme sent bears five large flowers, 4 inches across, with much of the general shape of P. Wallichii, but having a more open lip, and the spur reduced to a slight and very blunt protuberance, both of which characters show a decided approach to P. tuberculatus. A plant was exhibited at the meeting of the Royal Horticultural Society on March 11, under the above name, when it was awarded a First-class Certificate.

ANGRECOM PRIMULINUM, nat. hybr.⁷

A raceme of a very interesting little plant has been received from Messrs. Hugh Low & Co., of Clapton, with the information that it came from Madagascar, and that "the plant is exactly intermediate between Angrecom hyaloides and A. citratum." Racemes of these two species were also enclosed for comparison. I have a strong suspicion that it is a natural hybrid between these two species, as it is not only intermediate in habit, but also in some other characters. The raceme is very similar to that of A. citratum, and bears similar dark brown bracts, but the flowers are smaller and closer together; in fact, it bears seventeen flowers, while a piece of A. citratum of the same length bears only eleven. The spurs of A. citratum are an inch long, are twice sharply bent, and hang pendulous under the distichous raceme. In A. hyaloides the spurs are only $\frac{1}{2}$ inch long.

⁷ *Phaeus Cooksoni*, n. hybr.—Segments salmon-coloured in front, pale delicate pink behind. Lip slightly 3-lobed, throat $\frac{1}{2}$ inch across; externally deep yellow below, passing into reddish-maroon above, internally bright yellow on disc and base, marbled with crimson-brown on sides of throat, the rest marbled with two shades of reddish-maroon. The margin is somewhat undulate, and there are from one to three indistinct linear keels, the character apparently varying from flower to flower.

quite straight, and parallel with the pedicels. In our novelty the spurs are also nearly straight, and parallel with the pedicels, but are $\frac{1}{2}$ inch long. They are also a little flattened near their tips, as in A. hyaloides. In other respects the flowers much resemble A. citratum, except that the dorsal sepal is spreading, not bent forward over the column. The lip is also shorter and with a broader base. Both agree in having this part of the flower white, while all the rest is of a pale primrose shade. The pollinia appear to be more like A. hyaloides than the other species. At one time the question would have been whether it was an anomalous variety of A. citratum or a closely allied species; but there is now a third alternative, and I cannot help suspecting that it is a natural hybrid between the two species named, and tolerably intermediate between them, though with the characters of A. citratum predominating, except in the spur and pollinia. R. A. Rolfe.

NEW HYBRID NARCISUS.

We may be permitted, no doubt, to inform our readers of the fact, interesting to all lovers of the genus, that Professor Foster has obtained a remarkable and beautiful hybrid, now flowering for the first time. It has made a most successful debut in the form of a beautiful potful of many white flowers. These are sufficient attractions at first sight, but further observation suffices to show that there is something peculiar and novel about their form, which does not belong to the plant they first recall to one's mind. N. (Corbularia) monophyllus is clearly in evidence, but some other species, not so apparent, has given a bulge to the corona, which by information is known to be N. calathinus, of the distinct sub-genus Ganymedes.

It appears to be the first time that these sub-genera have been united artificially, the first time that either of the parents have taken part in the production of a garden hybrid, and the first time as it must be from their distant habitats—that these particular plants have ever married together. Though the sub-genera do hybridise in a wild state, it does not appear that either of these plants have illustrated the fact, as, indeed, from their out-lying homes, would be unlikely. The union, from different points of view, was happily made, and certainly so from the result, which partakes chiefly of N. monophyllus, having the same dwarf habit, much the same appearance of foliage and being of the same, or similar, white colour in flower. It is marked by the bulge of the corona, which helps it towards the fardingle form of N. calathinus. The future of this hybrid will be of interest, in one point to learn whether from the influence of N. calathinus, it will not, in some degree, be less special in its requirements than N. monophyllus, the other beautiful parent of this equally beautiful offspring. R. J. Lynch.

KITCHEN GARDEN NOTES.

SEWING ONION seed was sown in warmth in February, and the plants are now in a fit state to plant out, choose a nice, dry, quiet day, and prick them out with a somewhat blunt dibber (taking care to put the roots only under-ground); of course, this may be beside the main crop, or in any other situation. Strawberry plantings (for stock only) form a very suitable place, rows of these being usually 3 to 4 feet apart. I have frequently heard it said that pricked-out onions do not do so well as those sown where they are to grow, but I am certain that bigger bulbs may be obtained in this way.

Celery.—Sandringham or Sutton's Gem Celery may at once be sown, and a good red variety may be sown at the same time. In some heavy soils white Celery rarely comes to such perfection as do the reds, and therefore it should not be entirely relied upon for supply. I have found also that insects, slugs, &c., do not so readily attack the red varieties. Major Clark, Standard Bearer, Ivory's Non-such, are excellent varieties. The seed should be sown and treated similarly to the Onion, with the exception that it must be pricked off either into a

frame or boxes as soon as it is 3 inches high, and hardened off by degrees.

Brussels Sprouts are indispensable vegetables, and require a long season to grow, and plenty of space, if they are to be grown profitably. The earliest lot should stand 3 feet 6 inches each way. We cannot mention varieties; there are many of great excellence, and the choice lies between a good selection of the old-fashioned small Sprout and the new ones, that rival a Colewort in size. Three sowings should be made. The plants from the early sowings will grow to 3 and 4 feet in height, with sprouts the whole way up, but later-sown plants are dwarfier. Deep digging and liberal manuring are essential in all cases.

Cabbages.—The plots should be constantly looked over, and if slugs are making their appearance, soot and wood-ashes should be freely used on the soil around the plants, and the ground be made firm, as Cabbages do no good in loose soil. The best varieties are, for main crop, Ellam's and Veitch's Matchless, and Sutton's All Heart; and for early, Little Gem.

Loeks.—For fine Loeks, seed should have been sown in February, and treated like the Onion, till they were about 3 inches high, when they should have been pricked off into other boxes at a distance of 4 inches apart, and gradually hardened off, and finally planted out in well prepared trenches. In this way they may be grown from 10 to 14 inches in circumference. I prefer the Lyons to any other. W. A. Cook.

Asparagus.—No time should be lost in covering the autumn dressing of short dung on Asparagus beds with soil from the alleys, which was raked thereinto from off the beds in October. This should be broken fine with the spade before being distributed over the beds, and be afterwards raked over with a rake of medium size.

Summer Spinach.—A few drills, 12 inches apart, and 2 inches deep, should be sown between the rows of early Peas, or on a warm border, successional sowings being made at intervals of ten days or a fortnight. Sow the seed thinly, drawing the soil into the drill with the feet, and treading it before raking the ground. The young plants should be thinned out, first to 3 inches, and subsequently to 6 inches in the rows, and the Dutch-hoe passed between them a few times during growth.

Autumn-bearing Raspberries.—Where the cutting down to the ground of autumn-bearing Raspberry canes has been neglected, the operation should be performed forthwith, as this variety produces its fruit on canes of the current year's growth. H. W. W.

FLORISTS' FLOWERS.

THE RANUNCULUS.

OLD cultivators of the flower were much tied down to particular times to plant, and they obstinately adhered to the time-honoured dates. The time to plant the Ranunculus was in February, and when I first grew them I always tried to get them into the soil by the middle of that month, but I find after years of experiment that they do much better if they be not planted out before the middle or end of March. They like a rather clayey soil, but it is a good plan to have some fine dry soil to place over the tubers; and light sandy peat, decayed leaf mould, or road scrapings answer admirably, but the last-named materials should be well exposed beforehand. In planting try to get the tubers as nearly as possible at the depth of 2 inches. They like a soil that is deep and rich, and one that is retentive of moisture, few plants suffering more from drought than does the Ranunculus. J. Douglas.

THE GLADIOLUS.

The weather in March has not been favourable to planting. At one time, indeed, it was favourable, but the fine time did not last long, and March was ushered in with hard frost. I like to prepare the

ground for *Gladiolus* early in the autumn, and when the surface becomes caked, as it will with sun and rain, it is forked over, and always taking care to do so when it is in a dry state. By doing this two or three times in fine weather, the surface, even if it be a clay soil, becomes friable and in excellent condition for planting in March, but not if it is moved about or trodden upon in wet weather. I have sometimes found it necessary to plant out these and other bulbs and tubers when the ground has not been in the best condition, and in that case drills are drawn without treading on the ground to be planted, dry soil from the potting-shed being used to fill the drills.

Gladiolus corms should be planted 3 inches deep, and some sand put under and over each. The smaller corms I do not plant quite so deep. I like to get in the one-year-old seedling corms early in March, and these range from the size of a marrowfat Pea to a Filbert, but even those not much larger than a Pea will produce a flower-spike by the end of the season. These small sets grow away from the first with more vigour than do named varieties; indeed, some of these small corms will throw up a spike of bloom to the height of 4 or 5 feet.

KEW NOTES.

NATAL LABURNUM (*Calpurnia lasiogyna*).—This is a small tree, with the habit, leaves, and flowers of our native Laburnum, the general appearance of the two being so similar that non-botanical people in Natal look upon the *Calpurnia* as the same as the Laburnum of "home." A plant of it is now in flower in the succulent house (No. 5). It grows fast and freely, and shows well for flower; but hitherto most of the flowers have fallen owing to fogs and winter gloom. As a pot plant the *Calpurnia* does not promise to be of much value, but it will probably prove an ornamental plant for large conservatories in England, and for out-of-doors in countries where severe weather is not experienced. There is a poor figure of an allied species, viz., *C. sylvatica*, in the *Botanical Magazine*, t. 2617, under the name of *Virgilia intrusa*.

Anemone caffra.—Under the figure of *A. Fanninii*, published three years ago in the *Botanical Magazine* (t. 2658), Sir Joseph Hooker mentions the close relationship of that species with *A. caffra*, observing that:—"It may indeed prove to be a gigantic form of *A. caffra*, from which it differs chiefly in its very

been grown in the pot in which it was shown, but had been planted in a deep border of rich soil in a rather dry intermediate-house. Here it grew well, and when it was lifted the roots at the base of the bulb were as thick as a man's little finger, very fleshy, and they went straight down into the soil for at least 18 inches below the bottom of the bulb, which was buried in the soil and measured 10 inches in length. Where the roots were the soil would be constantly wet. This is the first time this interesting plant has flowered at Kew within the last ten years.

Godwinia spiss.—The odour emitted by the flowers of this plant is disagreeable and penetrating. The Kew example, an unusually large one, is now at its best (or worst), and consequently the house in which it stands is not a place to linger in. *W. W.*

CULTURAL MEMORANDA.

TUBEROUS BEGONIAS.

SEED may now be sown in well drained pans, affording them a temperature of 65°; the seed-

FIG. 57.—*BEGONIA COOKSONII*: COLOUR NARBYEN FLUSHED WITH PINK. (SEE P. 358.)

Heavy soils do not suit the *Gladiolus* so well as more sandy ones, but they will do well even in clayey loam, if the drills are filled up with a well prepared sandy soil, pressed down firmly with the back of a rake or a spade. About the last week in March, or early in April, *Gladiolus* seed may be sown, and where large quantities of plants are required, it can be sown on the open border, in beds of sandy soil; but gardeners and amateurs who may have space to plant only a few hundreds, would do well to sow the seed in 32-sized pots, each pot holding about fifty plants. The seeds vegetate in a mild bottom heat in about ten days, and as the plants advance in growth, more air must be admitted to the frame until the end of May, when the lights may be removed entirely. But I do not disturb them then, but leave them where they stand. As soon as the leaves turn of a yellow colour, that is in the autumn, the corms are taken up, and stored in dry sand for the winter. They must be watched closely about the ripening stage, or they will start into growth almost as soon as the leaves decay. *J. Douglas.*

ANEMONE HORTENSIS.—We have received a bunch of these welcome flowers of spring from Mr. Wolley Dod, accompanying a note describing the mode of culture pursued at Malpas, and which we shall print in our next issue.

much larger size, and the more rounded lobes of the leaf." A plant of *A. caffra* now in flower at Kew bears out this opinion, for there is nothing except size to distinguish one from the other. In *A. Fanninii* the leaves are 1 foot or more in diameter; the scape from 2 to 5 feet high, and the flowers are 4 inches across. In *A. caffra* the leaves are 6 inches across, the flowers nearly 3 inches across, and the scape is 15 inches high. There is a difference also in the hairiness of the plants, *A. Fanninii* being clothed with long silky almost villous hairs, whilst in *A. caffra* they are shorter and less abundant. Both species are worth growing for the sake of their large flowers, which last at least a fortnight on the plants.

Begonia multiflora, generally known in gardens as *B. Kalmeyerii*, is one of the most ornamental of the many species known, and it is now in bloom in the Begonia-house. It requires warm-house treatment all the year round; when the leaves fade, no water should be given, but when growth recommences the soil should be kept constantly moist. At Kew this plant, which is generally a failure under cultivation after the first year or so, has flowered annually for the last four years under this treatment, which is precisely the same as suits *B. Katherine*.

Begonia tociaria.—The plant of this now flowering at Kew, and which was exhibited at the meeting of the Royal Horticultural Society, March 11, has not

ling will soon appear above the soil, and should then be pricked off into pans of sandy soil, pressed firmly. If before sowing the seed the soil be watered thoroughly, only a slight covering of the seeds will be required, a little dry sand scattered evenly over it sufficing. A piece of slate should be placed over the pans, to be replaced by a piece of glass, and which need not be kept over them for more than a week, till the seed germinates. Damp is the great enemy to be avoided, which is best done by transplanting the seedlings as soon as they may be readily handled. With care, *Begonia* may be bloomed in July of the same year; the fine colours and forms may then be separated for planting in beds, or growing in pots, the following season. *Begonia* being gross feeders, they should be planted on well manured soil, and during full growth, watered with manure-water as the plants may seem to need it. Dryness of the soil must be avoided in hot weather, and the plants well syringed towards the evening. *H. Markham.*

GREVILLEAS FOR CUTTING PURPOSES.

We find *Grevilleas* very useful plants for foliage in winter and spring, remaining good for two or three weeks when used in vase bouquets. Seed should be sown at this season, and old plants re-potted. *Grevillea robusta* and *G. filicifolia* are the best species to grow, and will be found good substi-

tutes for Ferns. Grevilleas, if they get a good start in the early spring, do much better if planted out on a well-manured south border, and never allowed to suffer for want of water. The foliage under this kind of treatment is dark green and strong, much stronger than that of pot-grown plants. Young seedlings require a little nursing the first season, and a slight bottom-heat has advantages. Thrips and red-spider are troublesome pests if the plants are grown in a cool-house, but not when planted out. Lift the plants early in the autumn, the young growths being tender and readily injured by cold, and place them in a cool pit out of the reach of the sun, and syringe them twice daily until new roots form. *G. Wythes*.

GARDENIAS.

Cuttings or slips, with a heel of older wood, root quickly if plunged in a brisk bottom-heat, and, with proper attention, will make nice plants to flower in February next. The plants require warmth and moisture during growth, and a slight bottom-heat is of advantage at the first. Want of attention to watering is not unfrequently the cause of loss of leaf and other evils.

DRACENAS.

Probably the quickest way of increasing *Dracaenas* is to cut up a stem into pieces of 1 inch long, and put these into pots or pans, and plunge in a brisk bottom-heat, water being afforded very sparingly till growth appears to have begun. Whether pots or pans are used, they should be thoroughly clean and well drained, and the soil should be made firm. Dibble in the pieces 2 inches apart and 1 inch under the soil, and, when grown to a height of 3 inches, lift carefully and pot, and plunge in bottom heat after watering them. For table plants, the pieces are best put singly into quite small pots, which soon get filled with roots, and suffer no check by removal. *Dracaenas* may be assisted with manure-water, and should be kept quite clear of all insects, or loss of beauty will certainly take place. *H. Markham*.

THE TUBEROSE.

The bulbs of this plant may be potted in 3-inch pots as soon as they can be procured in February, and at intervals of a fortnight to July, and with suitable pits and houses in which to grow the plants, flowers may be procured from June to March following. In potting them, all the bulletts at the base must be rubbed off, and well-drained pots and a light sandy loam employed; the apex of the bulb should range half an inch above the soil. Plunge the pots containing the bulbs in a Melon or Cucumber bed, or in a shallow box filled with sawdust or leaf-mould; water them, and place the box over hot-water pipes in a forcing-house. When about 9 inches of growth have been made, shift the plants into 6-inch pots, and give them a position near the glass, all side suckers being removed without delay, and the plants, when well rooted, kept well supplied with water and liquid-manure thereat, and syringed overhead morning and afternoon of bright days, to check red-spider and promote growth, until the flowers begin to open. *H. W. Ward*.

THE BULB GARDEN.

IRIS ROSENBACHII.

This is an Iris to be remembered. It may be known as a fine and gaily coloured species, but until seen in quantity, as in the fine mass flowering in Prof. Foster's garden, it is impossible to understand what it now is, and what it promises to be. Any attempt to describe the numerous and distinct forms would probably result in failure, but it may be remarked that several of them inspire a vision of what the effect would be if they were separated and grown by themselves in quantity—something, at least, quite lively in spring gardening. Fortunately it is of easy culture and propagation, and it is likely

also to repay the best efforts of the improver, though perhaps it is not yet on record that it seeds freely. Difficultly, however, on this account is not to be anticipated; it is a plant to be required from dealers by the hundred. *R. I. Lynch*.

CROCUS STELLARIS.

For more than a century, I believe, the pretty, anomalous *Crocus stellaris* has been known in our gardens, while no one could solve the mystery of its birth. It has always been considered to be a hybrid between aureus and susianus, and this, I think, may now be taken as the fact. In a patch of ground in my garden, where aureus and susianus are growing in company, and seeding freely, an evident hybrid between the two appeared this spring. It conforms botanically with the old *stellaris*, differing only in its greater size and beauty. A specimen has been forwarded to the Kew Herbarium, a second blossom having been left on the plant to see if it will prove fertile. The origin of *Crocus sulphureus striatus* still remains unknown, but is probably the same. *R. Trevor Clarke, Welton Place*.

POTATO EXPERIMENTS.

The twenty-seventh annual report of the Michigan Board of Agriculture, recently issued, gives, among much valuable information, the account of some experiments on Potatos, which may prove of interest at the present planting time of this crop.

The soil in which the Potatos were grown was a sandy loam, which had been in Wheat for the two preceding years. The land was not manured immediately before the Potato crop, but had been enriched with farmyard dung freely for several years previous. The land was ploughed 7 inches deep, harrowed and marked with furrows 4 inches deep, and 3 feet apart each way. The Potatos were cut into pieces, having three or four eyes each. The cultivation was thorough during the growing season.

Eighteen varieties were planted in plots of $\frac{1}{2}$ acre each, the following data gives the name of the variety and the produce per acre of a selected twelve:

1. Beauty of Hebron	...	134 bushels per acre.
2. Dakota Red (late)	...	129 "
3. Thorburn (late)	...	129 "
4. White Star (late)	...	126 "
5. Alexander's Prolific	...	124 "
6. Chicago Market	...	119 "
7. Mammoth Pearl (late)	...	118 "
8. White Elephant (late)	...	112 "
9. Lee's Favourite	...	98 "
10. Early Mayflower	...	98 "
11. Raul's Blush (late)	...	92 "
12. Early Harvest	...	91 "

Nos. 9 and 12 were among the earliest; they were budded in about thirty days from time of planting. No. 1 grew the most vigorously, and seemed to withstand drought better than others. Of the medium ripening varieties, White Elephant is named as one of the best. This variety does not grow quite so smooth as some other kinds, and the tubers are not of quite so good shape, but after several years trial at this station, its merits are obvious. White Star is said to be one of the best late Potatos in the list.—*Experiments on Potatos at New York*.

We have also been favoured with a report of some elaborate Potato experiments, conducted during the past year, at the New York Agricultural Experiment Station, which embraces a list of varieties. Cuttings *versus* whole tubers of the same weight. Sprouted *versus* unsprouted seed tubers. The influence of treatment of the seed tuber upon the earliness of the crop. Fertilizers placed below *versus* above the seed tuber. The consumption of the seed tuber by the plant.

The conclusions arrived at by these investigations were that:—

A. Little or nothing was gained by using cut Potatos for seed, over whole tubers of the same weight.

B. Seed tubers, badly sprouted, yielded about $\frac{8}{5}$ per cent. less than unsprouted ones.

C. The earliness of the crop was not influenced by exposing the tubers to light and warmth before planting. There was a slight difference in the yield of merchantable Potatos in favour of the tubers exposed to the light.

D. The yield was materially reduced by removing the seed end of the planted tubers, there being an estimated loss of 20 per cent.

E. Fertilizers placed below the seed may be slightly preferable to placing it above, the gain being about five bushels per acre.

F. The more rapid consumption of the seed tuber on rich than on poor soil, is probably due to a more abundant supply of moisture. *J. J. Willis, Harpenden*.

FOREIGN CORRESPONDENCE.

ORCHIDS AT THE UNITED STATES NURSERIES.

FROM New York City by the Delaware and Lackawanna Railroad, along the beautiful and picturesque Orange Valley, the pretty village of Short Hills is reached, perhaps the prettiest in New Jersey, and where are situated the "United States Nurseries" of Messrs. J. R. Piteber & W. A. Manda.

The establishment is the development of the private collection of Mr. J. R. Piteber, and Mr. W. A. Manda was formerly superintendent of the Harvard University Botanic Gardens at Cambridge, Mass. The specialties of the firm are *Orchids*, and of *Cypripediums* nearly 400 species and varieties are grown. *Chrysanthemums* and other perennials receive a good share of attention, and it was from here that the famous *Chrysanthemum Mrs. Alpheus Hardy* was sent out.

The *Cypripedium*-house contains many striking specimens now in flower, amongst the more striking of which are *C. Salleri* Hayenanum, a beautiful golden hybrid (*C. villosum* × *C. insigne*), the pretty *C. Savageanum* (*C. Harrisianum* × *C. Spicerianum*), with its pretty dorsal sepal, inheriting the tint of the former; *C. pavonianum*, a dark coloured hybrid of *C. venustum* × *C. Boxalli*; *C. Leeanum*, and *C. superbum*, *C. insigne* Sandersæ, *C. Godseffianum*, *C. æanthum porphyrianum*, and the lovely *C. melanoptalum*, &c.

The Cattleya-house, in which some 800 plants are in flower, presents a good spectacle—the greater number of the plants are varieties of *C. Trianae*, including the lovely variety *Mrs. de Witt Smith*, which has a dark petal, and a remarkably dark and broad lip. Some specimens of *C. speciosissima* have flowers measuring 9 inches across.

I also saw for the first time the delightful white *D. Wardianum*, and the new *Lælia* introduced by this firm. *L. Arnoldiana*, in form like *L. autumnalis*, but of a deeper colour, and far more pleasing; it is named after one of America's most liberal patrons, Hicks Arnold, Esq., of New York City.

Other features are a mass of *Lycaste*, which includes some fine examples of *L. Skinneri* alba, with very broad petals; and a house full of *Odontoglossum crispum*, with a profusion of their pleasing arching spikes. The show-house contains good examples of *Phalenopsis*, *Angraecum*, *Epidendrum*, *Calathea*, &c. *Our American Correspondent*.

THE CHINESE LILY.

In a note on this plant at p. 207, vol. vii., inquiry is made as to what should be done with the bulbs after flowering. I find they will not flower during the succeeding year under any form of treatment, and have concluded that planting in the open ground would be the cheapest and easiest method of proving their future utility. There is but little ground for hope that they can again be made to give satisfaction under water culture, or, indeed, under any system of management, in the climate of England, or the northern parts of this country. The Chinese in the United States, as may be supposed, grow their sacred flower much more extensively than any other class of the inhabitants, and they invariably discard

the bulbs as useless after one year's service. In China, I am informed, they are retained for propagation. When an imported bulb has finished its growth, several smaller bulbs, it will be observed, appear in its place; and at present only Chinese skill—combined, perhaps, with some peculiarity of the Chinese climate—can impart to these the unusual size and floriferous character of the original. It is difficult to bring information of any kind out of a Chinaman, and when questions are put to him concerning the production of "Heoll Sin Fah" bulbs, he just assumes a look of more than usual cunning, and sagely shakes his head. If those celestial beings, with whom I am sometimes privileged to hold communion by means of divers signs and ejaculations, know anything about any process to which the bulbs may be subjected in China, they guard their secret with laudable determination. *M. Barker, Botanic Garden, Cambridge, Mass., U.S.A.*

PLANTS AND THEIR CULTURE.

PROPAGATION OF PLANTS TO FLOWER IN THE AUTUMN.—The work of getting plants in readiness for the autumn should be diligently carried on, so that the plants may have acquired strength by the time of flowering. The *Bouvardias* are fine plants, easily grown, and not delicate, and cuttings should now be taken from those that were cut down some weeks since, and placed in an intermediate-house. They should, if practicable, be taken off with a heel, as rooting is then more easily effected; place the cuttings round the sides of a small pot of sandy compost, and place in bottom-heat of 50°. The glass should be removed for a quarter of an hour daily to dry the foliage. More loam and less leaf-mould should be given *Bouvardias* at each potting they receive, and the old plants should be shifted into larger pots after the cuttings have been taken. They will be useful planted out in an intermediate-house, or they may be removed to a cold frame, finally hardening them off.

Begonias of the fibrous-rooted species are of service early in the autumn months. At Sion only a few sorts are grown, but a large number of new forms have been sent out by Messrs. Veitch, which are great acquisitions. *Adonis* is a beautiful winter bloomer; John Ince has large flowers of a rose colour, and the plant has a good habit, making it when full grown good for vases. Among the older species, which are good for autumn decoration is *fuchsioidea*, *hybrida multiflora*, *Digswelliana*, *insignis*, *Knowsleyana*, *Ruckeri*, *Socotrana*, and *Weltoniensis*. These should now be propagated, and cuttings chosen that are not attenuated, the striking of these being done in the usual manner. Keep the young plants when struck close to the glass, and pot off singly, finally shifting them into 3-inch pots. These *Begonias* will do well in a cold frame for the summer, that is, when they have filled their pots at the last shift. When in heat, in their earliest stages, the points of the leading shoots should often be pinched out. Last season's plants should be cut hard back, and, when broken, repotted, and given a warm house for a few weeks; they will produce a quantity of bloom during the summer months. A few pots of *Abutilons* may be grown in the manner advised for *Begonias*, growing them in rather small pots, and feeding liberally in the early autumn; plugging them in the open air for part of the summer, but removing them early in the autumn. *Eupatoriums*, which may now be propagated, will take up but little room during the summer, and will do well if plugged in a warm border in the open air. *E. Weinmannianum*, *E. riparium*, and *E. odoratum* are profuse bloomers. All of these plants take manure-water freely; as the plants increase in size, good loam and decayed manure only should be used, as it is a difficult matter to keep the plants healthy in hot weather if a light compost be used. *E. atrorubens*, a species requiring more warmth than the others named, may be kept in a pit or frame in the summer. *Eupatoriums* in summer time should be damped overhead at the close of the day, if it has been warm and bright.

Libonia floribunda and *L. penhrosensis*, if propagated at this date and grown in a compost of leaf-mould, peat, and sand, in a cold frame, make bushy plants by the autumn; an intermediate-house is best for them when first housed in the autumn; but a cool bottom during the summer, and when in bloom pre-

vents red-spider from attacking the plants. Another useful plant is the rather neglected *Linum Trigynum*, which requires much the same treatment as the *Libonias*, and which is subject to the same troublesome pest, red-spider. We dip our plants in tobacco-water in which is a little soft-soap, before removal to a warmer house after their summer growth is finished. *G. Wythes, Syon House, Brentford.*

THE ORCHID HOUSES.

CATTLEYA-HOUSE.—*Oncidium splendidum*, as it goes out of flower, should be kept on the dry side, until roots and growth are seen to be getting active. It is a fine winter bloomer, and the late importations of the plant seem to be of stronger constitution than the earlier ones. *Cattleya Schroderae*, a useful plant, comes into flower just when the majority of the *C. Trianae* are going over, and keeps up the show of flowers until *C. Mendellii* comes in. The plants are of very free growth, and last for some long time in flower. *Chysis bracteosa*, *C. Linnigii*, and *C. Chelsonii*, now pushing flower-spikes, should receive copious supplies of water. A sharp look should be kept upon plants of *Laelia anceps*, or the young roots may get damaged by insects, slugs, &c. The temperature may now be allowed to rise to 65° at night, and the house be thoroughly syringed and shut up soon after 2 p.m.

Intermediate-house.—*Cyclopogon cristata* and its varieties may be repotted. I like to grow the plants in shallow pans, and when the spikes of flowers are pushing up, I hang them up to the roof with wires, and in this way they are more attractive. Old specimens, which may not have been divided for some years, and are crowded, may be carefully parted, and placed in a mixture of one part turfy loam, two parts peat, and one of sphagnum moss.

Comperetia macrophylla and *C. falcata*, now pushing growths and roots should not be allowed to become dry at the roots. These *Orchids* do well in suspended-baskets near the glass. *Angraecum falcatum*, perhaps the prettiest of all the miniature *Angraecums*, should now be re-basketed or surfaced according to its needs, and very little water afforded now or at any other time, the plant being liable to damp off. The temperature of this house may now rise to 60° at night, and care should be taken that as the heat rises the atmospheric moisture is well maintained. *A. G. Catt, Parkfield, Worcester.*

FRUITS UNDER GLASS.

VENTILATION.—Ventilation of all forcing houses will necessarily require unremitting attention and care at all times during the day. Many of the evils noticeable afterwards will be traceable to fluctuations of temperature. Growth at this early stage is usually tender, and, therefore, very liable to suffer from these changes. Rust in Grapes, dropping of the fruits in Peaches, Nectarines, and Figs, are often caused by cold draughts of air; and on the other hand, a few minutes only of bright sunshine, without adequate ventilation, produces scorched foliage, to be followed usually by attacks of various insects.

Pineapples.—Fruiters if there is a likelihood of too many fruits ripening together, some of them may be removed to a drier and cooler place, but not before they are about half coloured. Queens and others, a stage later, may now have every encouragement to swell their pips, it being found that those fruits which have fully developed pips are more luscious in flavour than larger fruit, but which ripened prematurely, through having experienced a check, as, for instance, by overheating of the bed. Growth is now active, and watering must be frequently seen to; tepid liquid-manure at 60° may be afforded, dewing the plants overhead daily at closing time with quite clean water, those in flower or ripening excepted. The atmosphere should be in a dry state at least once a day, or unweedly crowns will form. The temperature in this house may reach 90°, or even 100°, at closing time, and the night temperature may fall to not less than 70°. Houses with an acute angle, facing due south, need a slight shade for a few hours in the brightest part of the day. Remove any gills or suckers not required for stock.

Succession and Potted Sucklers.—If the newly half-developed leaves are of a pale green colour, and their growth erect, it is a sign that they are lengthening too rapidly, and that bottom-heat is in

excess, or ventilation is scanty, one or both, and which no after-treatment will modify. *W. Crump, Madresfield Court.*

THE KITCHEN GARDEN.

TOMATOS for planting outside should be potted up, putting two plants in small pots, and employing a rather light soil at this potting. Give a gentle watering with a fine rose-pot, and place the plants on a shelf near the glass, shading them till they begin to root into the new soil. For the present, a temperature of 55° to 60° by night will be high enough, and the plants be slightly dewed over daily in bright weather. Where Tomato seed has not been sown, no time should be lost in getting it in, growing on the plants quickly, or poor crops of fruit will result.

Turnips.—A moderate sowing of Early Manich and Snowball should be made on a warm border. The first-named variety is remarkable for earliness, but it does not keep good for any great length of time. It will be advisable to sow again in the second week of April, as these early sowings soon run to flower. Sow the seed in drills about 18 inches apart, and cover over with burnt garden refuse ashes. Turnips should be grown on rich land, as a poor soil produces stringy, hot-tasting bulbs. To prevent loss of seeds by birds, slightly damp them with milk-and-water, and roll in powdered red-lead. Turnips which may have been left in the open should be pulled up, the tops trimmed off, but the roots left entire, and be pitted in a cool place. Those required for tops should be left undisturbed.

Beet.—A small sowing may now be made, but the first week in May is soon enough for the main sowing. Ground that has not been recently manured is best for Beet; it should be deeply dug and well pulverised, and five seeds dropped in at distances of from 8 to 10 inches apart, the rows being 15 inches apart.

Carrots.—If not already done, make a good sowing of early Nantes on a sheltered border, and the main crop may be got in when the weather is suitable. Sow the long rooted kinds on deeply trenched soil, well worked, free of lump and stone, and rank manure, 1 foot from row to row. Before sowing the seed, rub it first between the hand, mix some dry sand with it, otherwise the separation of the seeds is difficult; sow evenly and not too thickly. If maggots be troublesome, dress heavily with soot and lime previous to sowing, and cover the lines with dry soil and wood ashes.

Basil may now be sown in heat, transplanting it when large enough to handle. Seed sown outside in May will form a succession to this sowing.

Capsicums.—Seeds should be sown in pots in heat, and pricked off when ready, putting three plants in small pots and shifting them into larger size when well rooted; at the final potting, employing a rich loamy compost, and potting with moderate firmness. Golden Gem, Bird's eye, Prince of Wales, Long Red, and Monstrous Red are useful varieties.

Herbs.—Tarragon plantings of this herb should be made each alternate year in a warm place, in the herb garden, and the soil in which it is planted should be in good heart. Divide the roots, and plant in patches, at 10 inches apart or less, according to size of plants. Chamomile, Pennyroyal, Fennel, Chives, the Thymes, Balm, Winter Savory, may likewise be divided and replanted. Dill, Chervil, Burrett, andORAGE may be sown on prepared beds, covering the seed with fine sandy soil. Sage, Rue, Lavender, &c., may now be propagated by slips, planting those on good soil, deeply dug, making them very firm. Thyme may be increased by seed sown in pans in a slight heat, but when grown from divided roots the pieces should be made very firm in the earth, otherwise they will not grow well. *H. Markham, Mere-worth Castle, Maidstone.*

SNOW IN THE RIVIERA.—Mr. Hanbury writes from La Mortola, near Ventimiglia:—"The winter has been favourable, excepting the fall of snow, which took place on the 2nd, covering everything to the depth of 3 inches for about twenty hours, with less damage, however, than might have been anticipated. The two preceding occasions, when I have seen snow here, were March 9, 1883, and Dec. 1, 1879, both far worse in their effects than this time."

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, APRIL 3.—Linnean Society.

SHOWS.

TUESDAY, APRIL 1—Hoddington Hyacinth.

WEDNESDAY, APRIL 2—Royal Caledonian, at Edinburgh (two days).

SALES.

MONDAY, MAR. 31—Lilies and Plants, at Protheroe & Morris' Rooms.

TUESDAY, APRIL 1—Roses, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.

WEDNESDAY, APRIL 2—Roses, Fruit Trees, Shrubs, and Border Plants, at Stevens' Rooms. Lilies, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.

THURSDAY, APRIL 3—Orchids in Flower, Lilies from Japan, &c., at Stevens' Rooms. Nursery Stock from Sample, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41° 6.

SALAD-EATING, like the consumption of raw fruit, is a survival from those primitive ages, when cooked food was much less indulged in than in these pampered times. Both supply the craving experienced by man for a succulent food that shall still his thirst, gratify his palate, and supply the materials out of which his tissues are manufactured, although the last-named acknowledged facts were as unknown to the primitive man as the construction of his brain.

We are reminded how various are the materials out of which a European salad is concocted by an admirable paper read by M. HENRI DE VILMOHIN, of Paris, before the meeting of the Royal Horticultural Society on Tuesday last. How varied must be the salad plants of China, India, and Persia? We may divide mankind roughly into salad eaters and salad abstainers, the proportions of the former to the latter being in inverse ratio as we recede from the warmer parts of the earth and approach the cold north.

The consumption of salads has made considerable headway in these islands within the last quarter of the century, and like sea-bathing, which was also in its beginning fifty years ago, is the outcome of fuller knowledge of the requirements of a healthy system of living.

We can recollect when a salad, if we except one made with Cos Lettuce, Mint leaves, sugar and vinegar, and perhaps flavoured with young Onions, was rarely found in the house of the man of moderate means. Even now at the tables of the rich the salads are extremely monotonous, although the materials at hand are varied enough; and the dressing is nearly always the same. "Does the lassie think I'm a coo," aptly expresses the attitude of a native of the northern part of our own island, when he had a plate of salad put before him one warm summer's day in a house of refreshment in a Midland town. And truly a salad to be enjoyed to the full, should be eaten in warm weather, or at least in a warm apartment, and where the warmth and dryness of the surrounding air tend to develop a certain degree of thirst. In winter the salad seems, to the ordinary man, an addition to the repast that might well be dispensed with, or is one that should be cooked first, and get its dressing according to taste afterwards. But, after all, the consumption of salads at all seasons is an acquirement, as will readily be granted by those whose lot has been cast with the salad-consumer's *par excellence*, the Italians, French, and the Southern Germans, and less so the Poles and North Germans.

At the tables of the first three salad is eaten almost every day, especially by townfolk, and in summer time it is as certain to appear as is the soup; and it must frequently be confessed that it is often more palatable than that. The real salad-lover scorns "dressing," as the inhabitants of these isles understand it, and gets his due admixture of flavour from the ingredients themselves. The bulk of a salad may consist of Cabbage Lettuce, rarely Cos, Endive, Chicory, Cucumber, Celeriac, Beetroot, and Cauliflower, the three last-named cooked, of course; but flavour will be cunningly added, and generally by the guest himself, with a little Chervil, an atom of Spearmint, more liberally of Tarragon, Parsley, the young blossoms of the gay Nasturtium, Water-cress, or some other kind of Cress.

An Italian, Hungarian, and Croatian will add Garlic, but rarely Onions. Of course there is no social ostracism for the Garlic eater, as with us for the consumer of the more delicate Onion! Garlic, with its insidious, all-pervading odour, may have its uses, medicinal or otherwise, in countries tainted with miasma, and where stomach complaints are common, but to the native of this country it is usually an abomination. *Aprapes* of the bulb, it is an interesting question, as in what form a certain large firm of pickle-makers disposes of 50 tons of it a-year! Does the Briton consume it as sauce, or is it exported?

Out of our own country the Cos Lettuce and blanched Celery are seldom eaten raw, and yet with Radishes and Beetroot they have hitherto formed the main part of our salads. But we find instead the Cabbage Lettuce, which is botanically a fixed sport of Cos Lettuce, and to which its origin is traceable in the various forms now grown, largely used abroad.

Cabbage Lettuces are now grown in all good gardens, although for marketing purposes the Cos variety still holds its own—more being grown of the latter in weight per acre, and the plant does not need so much care in packing for market, although the troublesome tyeing which nearly all market garden strains of it need, should tell with "cute men against its almost exclusive cultivation near London and other large towns.

No salad is either quite palatable or good for the stomach without the addition of oil, and the

first step in making the salad popular will be in the acquisition of a taste for Olive oil, or its excellent substitute, that expressed from the seeds of the Cotton plant, and when we are assured that the major part of the sardines we eat are preserved in the latter, it should not be so difficult of acquirement.

The Lettuce in all its varieties is of the easiest culture, if only certain conditions are fulfilled. It must have a moderately deep soil, and if it incline to a loamy nature so much the better. It must be well manured with substances quickly available for plant growth, for it is a plant whose life is very short; and if, therefore, animal manure be used, it should be in a thoroughly decayed state. On some soils not rich in humus, decayed leaf-mould grow Lettuces quickly and to a good size. It is not a good plan to dig ground for Lettuces long before it is to be planted, the moisture needed by the plant becoming soon evaporated from the surface, in warm weather at least, and watering becomes an almost daily necessity. Dig the ground, trample it well, and put out the young plants, which should have been pricked out in beds. Market men, with their rough-and-ready ways, draw direct from the seed-bed, and plant with the dibber; but planting prepared plants with the trowel is far better, as there is then little check given to growth, the plant suffering next to nothing by its removal. Some kinds of Lettuces need a distance of 15 or more inches between the plants, but as a rule 1 foot is about a suitable distance at which to plant. Some of the small varieties, like Tennis-ball, Tom Thumb, Black-seeded Dutch (*Laitue monté à peine verte, a graine noire*), a pale green variety, small dark red, and a few others need scarcely so much space as this, unless the ground be very rich. By paying proper attention to the sowing of seeds of various kinds of Lettuces, they may be obtained all the year round. The first sowing beginning with the year should be made early in February in a stove or succession Pine-pit, not in a warm frame, as the plants would be liable to damp off there, unless very carefully handled. The seed pans should be gently watered, and allowed to get dry on the surface when the seeds may be sown, and a little sandy leaf mould sifted over, just enough to hide the seeds. Water again quite lightly, and stand the pans, protected with a tile or a sheet of brown paper, anywhere until germination has begun to take place, when the pans, without the loss of an hour, should be put on a shelf near the light. Shading will hardly be necessary if watering is duly attended to.

There may be two sowings made in this way in February, and the plants resulting from these must be pricked off into other pans and boxes, allowing space for development. A sowing may be made in March in a frame on a bed of fermenting leaves, and all after-sowings, at intervals of ten or fourteen days, may take place in the open air under a hand-glass for the first two of these, followed by several on a south border. The midsummer sowings may be made on a north border, and the early autumn and last sowings on a south border.

The plants raised in the bothouses in February are intended for growing on mild hotbeds, and should be put into these before the expiration of March.

A bed for forcing on Lettuces need not have a greater warmth at bottom than 75°, which will be high enough, with due attention to linings of warm manure at the sides failing hot-water pipes for top heat. The night temperature of such frames should range between 55° and 60°, with some small amount of ventilation, and ventila-

tion should be freely afforded by day in fine weather.

Matting up the frame must be well done in the event of severe weather occurring, and straw or bracken may even be needed at

either from the seed-beds or sow thinly in lines, and leave a crop of plants by thinning out all the superfluous ones. In hot weather there is something to be said in favour of sowing and thinning out, but watering must be carefully attended to,

the surface, as would otherwise be the case. Lettuces sown and thinned out are the better for being moulded up slightly when half-grown, that is, up to the lower tier of leaves; they are thus kept from wind-rocking, and the additional

FIG. 58.—CITRUS JAPONICA. A, SECTION OF FRUIT; B, FLOWER FROM WHICH THE PETAALS AND STAMENS HAVE BEEN REMOVED, TO SHOW THE Ovary, SURROUNDED AT THE BASE BY A CUSHION-LIKE DISC. (SEE P. 352.)

such times, remembering that any check to growth is injurious. Stirring the surface soil round the plants at frequent intervals is of great help to Lettuce growing, and must not be omitted either in frames or the open ground.

Some good kitchen gardeners do not prick out their later sowings of Lettuce, but they draw

and the thinning done before the plants have had time to spoil by being crowded together. In planting out summer Lettuces, the plan of drawing a drill 3 inches deep is a good one, as it puts the roots at once into a moist medium, shelters them somewhat from the sun's rays, and the water afforded the plants is not spread over

soil drawn over the roots preserves the moisture about the latter.

In Northern France and Belgium, the *cloche*, or bell-glass, is largely in use for forwarding and protecting Lettuces, but whether it be due to their expense, or the impossibility of repairing them when broken, or because our gardeners do

not understand their uses, these capital aids in growing early Lettuces, Cauliflowers, Rhubarb, Peas, &c., are not much in vogue with us.

We believe the secret of management is, where Lettuce is concerned, to give little or no air in late winter and spring, ventilation inducing toughness in the leaf of the plant, and the cold winds check its growth. The different varieties of Lettuce form the bulk of our salads, but adjuncts besides those already named are found in the leaves of the following—Whitloof, a superior kind of the common or Bitter Chicory; Endive, plain, curled, and moss-curl'd; Dandelion, the common form; Salsify, Scorzonera, Skirret, Rampion, Cress of all kinds, the tip of Asparagus shoots, Borage flowers, Tomatos, Red Cabbage, Stachys, Chives, Capsicums, Onions in a small state, and hard-fleshed close cooked Potatos—used cold.

To give directions about growing these various plants would unduly lengthen this glance at the salad question, but we will just give a few of Mr. DE VILMORIN'S remarks on Dandelion culture as practised in Belgium, its head-quarters, and about the outskirts of Paris. The ground for the plant should be deeply dug after being well dressed with decayed manure. When the ground is dry on the surface, say in March, it should be very firmly and evenly trodden, and made level. Drills should then be drawn as for carrots at 18 inches apart, and the seed dropped therein in bunches of five or six, at the same distance apart in the drills, for the plant being of spreading habit requires considerable space in which to develop. Thinning out the bunches of plants must be done by hand before they get large, and these thinnings will do to fill up gaps in the rows if the tip of the root be not lost. Summer culture consists of keeping the ground clean. In late October the leaves may be cut off 2 inches above the crown, and earth drawn over them as in moulding up the Potato. Here the plants are safe for the winter, and may be dug up entire and forced after the manner of Chicory, that is in a dark place with a warmth of 60°, or the plants may have pots put over them, and over all warm manure, to give the required impetus to growth. In cutting the crop, as also that of Chicory, which gets similar culture, a slice of the root is taken, not for eating, but as tending to keep the leaves fresh for a longer time than could otherwise be done. The price fetched by blanched Dandelion leaves ranges from 8s. to 20s. per cwt.

Mr. DE VILMORIN'S lecture was well attended, well delivered in irreproachable English, and contained details concerning some salad plants little used in this country, to our great and unnecessary loss. For the full text of this important communication we must await the publication of the *Journal* of the Society. As gardeners will be eager to know what so high an authority had to say on a subject so interesting to them, it is to be hoped that no long delay will ensue before it is issued.

FLOWER SHOWS FOR APRIL.—The following list includes all the fixtures of which we have received information: On the 1st, Haddington Hyacinth Society; on Wednesday, 2nd, Reading and Royal Caledonian Society, 2-day spring show at Edinburgh opens; on Tuesday, 8th, the Royal Horticultural Society meets at Westminster; and on the following Tuesday (the 15th), the 4-days Daffodil Conference and Show opens at Chiswick; a 2-day show opens at Newcastle-on-Tyne on Wednesday, the 16th; on Thursday, 17th, there is a show of the Royal Horticultural Society of Ireland at Dublin; the Royal Horticultural Society meets at Westminster on the 22nd, when the exhibition of the National Ariculture Society will be held in conjunction. On Wednesday, 23rd, Royal Botanic Society's second spring show; and on the 29th, the second spring show of

the Manchester Royal Botanic Society, and the Royal Aquarium Co.'s second show (2 days), opens.

PROTECTION FOR PLANTS.—There is an idea afloat that the "Association pour la Protection des Plantes," has induced the Swiss Government to order the destruction of plants sent through the post. This is an absurdity, of course, but is probably founded on the equally absurd Phylloxera regulations which effect a minimum of good at a maximum of expense and inconvenience. All that we can say is, that on the day of writing we have received two packets of living plants by post, one from Switzerland, and one from Italy. We have received an official denial of the statement referred to, which we shall publish next week, being precluded from doing so now by the great pressure on our space.

THE BRITISH FRUIT GROWERS' ASSOCIATION.—Mr. L. CASTLE, Honorary Secretary of the above, informs us that a meeting was held in the Town Hall, Ellesmere, Salop, on Saturday, March 22, at 7 p.m., by members of the above Association, in conjunction with the local Society. BROWSTON R. O. TOWER, Esq., occupied the chair, and Mr. J. WRIGHT'S lecture upon "Profitable Fruit Growing" much interested a large audience. Several other members took part in the discussion which followed, and the meeting was highly satisfactory.

THE DAFFODIL EXHIBITION AND CONFERENCE AT CHISWICK.—The following schedule has been issued. For the better examination and comparison of the flowers, it is particularly requested that exhibitors will divide their collections into the following classes:—1, Corbularia; 2, Ajax (yellows only); 3, Ajax (bicolors only); 4, Ajax (white or pale sulphur, *eg.*, albicans, cernuus, Moschatum pallidum, Præcox, tortuosus, &c.); 5, Incomparabilis, Barri, and Leedsi; 6, Humei, Backhousei, Nelsoni, montanus, Macleani, Sabini, Bernardi, and tridynus; 7, triandrus; 8, Burbidgei, poeticus, odoratus, junceifolius, and jonquilla; 9, gracilis, intermedium, Polyanthus, and double Polyanthus; 10, double and semi-double Daffodils of all kinds (*eg.*, Ajax, incomparabilis, odoratus, poeticus, jonquilla, &c.), except Polyanthus; 11, new or unnamed seedlings of the Ajax classes; 12, new or unnamed seedlings of any other class than Ajax. No doubles or semi-doubles may be shown in Classes 1 to 8 inclusive. Various prizes are offered.

The arrangements for the Conference are as follows:—Tuesday, April 15.—The judges and committees of selection will be engaged in examining the flowers and drawing up their reports. Fellows will be admitted to the Gardens at 1 p.m., and the public at 2 p.m. H.R.H. the Princess Mary, Duchess of Teck, has kindly consented to open the exhibition at 3 p.m.

Wednesday, April 16.—Admission to the Gardens at 11 a.m. The Conference will be opened at 2 p.m. by Professor MICHAEL FOSTER, Sec. R.S., President of the Conference, who will deliver an opening address. Mr. C. R. SCRASE-DICKINS, Secretary of Narcissus Committee of the Royal Horticultural Society, will give a short *resumé* of the work done by the committee since its appointment in 1885, and will present the report of the committee as to the exhibits and awards of the judges. The following papers will then be read, and discussion invited: "Historical Account of Cultivated Narcissi," by Mr. F. W. BURRIDGE, M.A., F.L.S. Mr. T. A. DORRINGTON has been asked to read a paper on "Daffodils in the Scilly Islands." "The Poeticus Group," by the Rev. G. H. ENGLEHEART, M.A.

Thursday, April 17.—Admission to the gardens at 11. The Conference will be resumed at 2 p.m., Mr. J. G. BAKER, F.R.S., in the chair. Papers to be read:—"On the Natural History and Cultivation of the Trumpet Daffodil and its Hybrids," by the Rev. C. WOLLEY-DOD, M.A. HERA KIRKAGE has been asked to read a paper on "Polyanthus Narcissi." "On Irish Varieties of Daffodils with special reference

to the white forms," by Mr. JOHN T. BENNETT-POR. "Notes on Seedlings and Seedling raising," by the Rev. G. H. ENGLEHEART, M.A. "Daffodils for the London Market," by Mr. JAMES WALKER.

Friday, April 18.—Admission to the gardens at 11 o'clock. The Exhibition will close at 4 p.m.

Intending exhibitors are requested to communicate with Mr. BARRON, Superintendent, Royal Horticultural Society's Gardens, Chiswick, on or before Friday, April 11, stating the classes in which they propose exhibiting, and giving an approximate idea of the amount of space they will require.

LINNEAN SOCIETY.—On March 20, Mr. W. CARUTHERS, F.R.S., President, occupied the chair. Mr. G. F. SCOTT ELLIOTT was admitted and Mr. H. E. MILNER elected a Fellow of the Society. After reading the minutes of the last meeting, the following resolution was moved from the chair and unanimously adopted, "On the occasion of a gift from Mr. CURTIS of a handsome oaken table for the meeting-room, the Society desires to record its deep sense of the valuable services rendered by that gentleman not only as Treasurer, but by numerous acts which are not generally appreciated because they are practically unknown to the Fellows." Professor P. MARIN DUCAS, F.R.S., exhibited several specimens of *Desmophyllum cristagala*, obtained from off an electric cable at a depth of 550 fathoms. Though showing great variation in the shape and nature of the wall, the specific characters of the septa were maintained. The core extending as a thin lamina far beyond the peduncle, had no connection with the septa. A section of *Carophyllia clavus* showed stem between the septa, and a section of *Lophelia prolifera* exhibited a true stem extending beyond the septa.

THE TRADE IN APPLES IN DENMARK.—In a recently issued Government Report on the trade of Denmark, it is stated that the exportation of Apples has very largely developed. The Apple trade has always been one of local importance, and during the autumn and winter months rows of small craft from the Islands of Lolland, Fyen, &c., may be seen moored to the quays, whose cargoes are entirely composed of this fruit, laid up in this manner for the winter; and, roofed over with deal planks, they become floating fruit shops, dealing directly with the consumer. It is only quite recently that attempts have been made on any scale to promote the export of the fruit. It seems that a society has been formed for promoting the export of garden produce, and that during the past year they exported over £5000 worth of Apples and Tomatos, fetching an average price which made the ground occupied five to six times more profitable than if devoted to the cultivation of corn, grass, or roots. The Society having thus created a market for this produce in England, the demand rapidly increased, and further purchases were made in Denmark, amounting to over £555,000! In addition to this, there have been simultaneously large quantities exported to Hamburg, so that an industry which had hitherto been of comparatively small importance, has, during the past year, been successfully developed. It is stated that the Apple chiefly selected for the foreign market is the agreeable winter-eating kind known as the Gravenstein.

"LE JOURNAL DES ORCHIDÉES."—Another publication devoted to Orchids! Another little stranger to be welcomed into the horticultural press. This time our salutations and good wishes are claimed by the *Journal des Orchidées*, of which the first number is before us. It is an octavo of twenty pages, and is to be published fortnightly. The periodical is to be devoted expressly to the cultivation of Orchids, concerning which, according to the Editor, there existed previously no practical guide—a statement which surprises us not a little, but it is the function of youth to create surprises. Among articles conforming to the programme we find Notes on the Potting of Orchids, on the Culture of Orchids in Dwelling-rooms and for Market Purposes (*grand*

culture), together with general directions for the month. The Editor proposes to take a *plebiscite* or popular vote as to the best twenty-five *Cypripedia*; the next best set of twenty-five; the twelve species or varieties suitable for cut flowers or market cultivation; and as to the species and varieties to be eliminated from all select collections as unworthy of "house room." The Editor of the new journal, which has our hearty sympathy, is M. LUCIEN LINDEN. The office of the journal is Rue Belliard, 100, Brussels; and the cost of subscription 10 francs a year.

PLANTS AT LA MORTOLA.—The collection of plants in Mr. HANBURY'S garden near Mentone, excites the admiration and astonishment of northern visitors. Its treasures have often been commented on in these columns, and quite recently have been treated of in the *Kew Bulletin*. Now we have before us a catalogue in two parts of all the plants growing in the open air in that establishment, compiled by Mr. G. CROWEYER. We estimate the number of entries at nearly 4000, and of these about 500 were, we learn, in flower on New Year's Day. In one part the plants are classified under their respective natural orders, the name of each plant being given as well as that of its sponsor, the work in which the name is registered, the period of flowering, and the native country. In the other list the names of plants are arranged alphabetically, whilst in an appendix they are all grouped according to the geographical regions from which they come. Plants indigenous to Italy are marked with an asterisk (*). Such a catalogue will be of great service to those interested in the botany of garden plants.

TREES FOR STREET PLANTING. Mr. WILLIAM HOLMES, of the Frampton Park Nurseries, Hackney, who has had considerable experience of planting in different parts of London, expresses the opinion that Planes and Poplars are much the best suited for street planting in cities and towns. He particularly recommends *Populus canadensis nova*, or Rumsey's Egyptian Poplar, as more likely to enable the planter to surmount the many difficulties experienced in the successful culture of trees in streets than any other. He has witnessed many illustrations of the fact, that this form of the Poplar will live and grow for years in positions where Planes will scarcely last for a season. The space in front of the London Hospital at Whitechapel affords an illustration in point. Planes were planted and died; they were renewed, and again died; when Mr. Holmes suggested the employment of this Poplar, and several were planted, with the satisfactory result that they have now stood for six and eight years, making a really splendid growth. Again at Silvertown where some reclaimed land had been filled up to a depth of from 12 to 11 feet with London clay and soil, vitiated by an atmosphere charged with impurities from the many chemical and other works in the immediate neighbourhood, Mr. Holmes had an opportunity of experimenting with trees, and he found that Poplars and *Ailanthus glandulosus* would alone endure; most of the others died the first season, and the remainder, with very few exceptions, the second year. This is a valuable testimony, well worthy the attention of planters.

THE GENUS EPHEDRA.—Dr. OTTO STAFF, of Vienna, has lately published a monograph of the genus *Ephedra*, accompanied by an introduction treating of the morphology and distribution of the species, some of which are in cultivation. The work seems very thoroughly done, but it is to be regretted that contrary to usage the author divides the genus into sections, and these into tribes, thus making the tribe of lower value than the genus. The ordinary sequence is tribe, subtribe, genus, subgenus, section, and any departure from this convention is embarrassing. In dealing with the species, the author gives first of all a diagnosis, then a full description and an account of the varieties. These are happily all in Latin. Then comes a paragraph

devoted to the geographical distribution, which is in German; others to the literature and synonymy, all very fully treated. The uses to which various species are put, occupy a separate section, and another is given to the uses of the several species. Fine quarto lithographic plates accompany the monograph, which though confined to less than forty species—or perhaps for that very reason—is one of the most complete of its kind.

STOCK-TAKING: FEBRUARY.—According to the Trade and Navigation Returns for the month of February, "minus has it," as will be seen from the usual excerpts, given below. Either, then, we have been overdoing the business of importing, or the purchasing power is lower. The former is probably the case, for we find a large increase in the exports of British produce and manufactures. Our abbreviated summary runs as follows:—

	1889.	1890.	Difference.
Total value of imports	£2,249,000	£1,918,842	-1,321,258
[(I).—(A.) Articles of food and drink—duty free	9,742,305	9,138,840	-204,115
(B)—do., dutiable	1,142,812	2,185,372	+1,042,560
[(V).—Raw materials for textile manufactures (including Flax, Hemp, and Jute)	8,411,350	7,135,890	-1,275,460
[(VII).—Raw materials for sundry industries (including wood and timber, hewn, sawn, split, dressed; vegetable materials; for paper-making, &c.)	2,734,142	2,419,543	-214,599
[(IX).—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed)	1,771,074	1,335,908	-435,166

By the way, one is apt to wonder how it pays to invest in sugars. Things have altered—for the consumer—very much within the last few months; our grocers are selling sugars at from 1½d. per pound, and through various farthings and qualities, of course, up to 2½d. The following extract from the general returns possess their usual interest for the fruit and vegetable growers and vendors:—

	1889.	1890.	Difference.
[(H). Fruit:—Apples, raw	1,058	479,785	192,866
Unenumerated, raw	9,921	19,067	1,686
Onions	311,668	313,185	27,592
Potatoes	23,345	26,517	2,828
Vegetables, raw, unenumerated	410	411,186	410,876

Judging alone from the increased volume of the Returns—25 per cent. over last month's—it would seem as if our manufactures were increasing in variety, and the "market range" widening.

KINGSTON AND SURBITON CHRYSANTHEMUM SOCIETY.—The above society has now entered on its fifteenth year; its finances during a rather checkered career being looked after by Mr. JOHN DREWETT, and to him was due much of the credit of its recovery from the low ebb to which it had fallen. Some few of its supporters felt that a tangible mark of their appreciation of Mr. DREWETT'S efforts should be made him, and contributions were privately solicited to that end, and which amounted to £36. The gift took the form of a gold watch, a "Tantalus" stand for the sideboard, and an inscription on vellum. The presentation took place on Saturday, March 8, at the Kingston Hotel.

RARE PLANTS AT GHENT.—M. A. VAN GERRP, of Ghent, has a magnificent variety of *Cattleya Trianae* in bloom, with very broad petals. The colour is pure white, flushed with the lightest rose tint. In the same establishment is a delicate form of *Cypripedium grande* X, superior in form

and colour to any that we have seen before. A very rare Fern, *Gymnogramma Muelleri*, introduced about twenty-five years ago, is to be seen here. It is quite unlike an ordinary *Gymnogramma*, and recalls a fossil Fern. M. DALLIERE has a new form of *Eucyrtium* from Japan, and which goes by the name of *E. japonica microplylla variegata*. It is a pretty little dwarf shrub, of compact habit, and small, delicate foliage, the leaves lanceolate, green-veined, and spotted with pure white, thus producing a highly decorative effect. The plant is hardy, and of rapid growth, and is well suited for an edging plant.

WILDSMITH MEMORIAL FUND.—In addition to the sums previously acknowledged, which amounted to £45 3s., the following have been received or promised:—

£ s. d.	£ s. d.
George Palmer, Esq.	Mr. J. Hutson
J.P. ... 5 5 0	Mr. E. Butler ... 10 0 0
Sir Henry and Lady ... 10 0 0	Mr. W. Cook ... 10 0 0
St. John Milmay ... 5 0 0	Mr. W. Gilbert ... 10 0 0
Lady Cottingham ... 2 10 0	Mr. P. Cotchford, Esq. ... 10 0 0
W. B. Myers, Esq. ... 2 2 0	Mr. G. Binyard ... 10 0 0
Rev. G. J. Thomas ... 2 0 0	Mr. A. F. Kiron ... 10 0 0
Mr. Marsland ... 1 10 0	Mr. J. K. Petch ... 10 0 0

Rayley ... 1 10 0	Mr. W. F. Bales ... 10 0 0
Mr. W. H. Lees ... 1 0 0	Mr. J. P. Jones ... 10 0 0
Mr. E. Molevoux ... 1 0 0	And in amounts under ... 6 7 0
Mr. T. B. Myles ... 1 0 0	Making a total of £94 9 6

up to date. Further subscriptions are still required, as the requisite sum has not yet been obtained.

ROSE SHOW FIXTURES, 1890.—Mr. MAWEY kindly forwards the subjoined list of dates:—June 24th, Drill Hall, Westminster (N.R.S.); 27th, Royal Aquarium; 28th, Eltham, Reigate. —July 1st, Canterbury, Hereford. Sutton; 2nd, Crofton, Dursley, Hutehin; 3rd, Bath, Farningham, Norwich; 5th, Crystal Palace (N.R.S.); 8th, Gloucester, Ipswich, Winchester; 9th, Diss, Ealing, Taunbridge, Wells; 10th, Birkenhead, Workop; 17th, Birmingham (N.R.S.), Helensburgh; 22nd, Tibshelf. The only Rose show which extends over more than one day is that at Winchester, which will be held on July 8 and 9.

PLANT PORTRAITS.

- ALFIEDI HOPELLEI*, *Orchidophile*, January.
- ALIVUM CAVANUM*, *Gardenfiest*, March 1, t. 1817. Leaves trifoliate, flowers umbellate, blue.
- ALIVUM KANSSENSIS*, *Gardenfiest*, March 1, t. 1817. —Leaves linear-lanceolate, flowers umbellate, blue. —Flowers, single-flowered varieties, *Illustration Horticole*, t. 97. —1, Hemisphère, scarlet; 2, Linneus, rose; 3, Jussieu, rose; 1, Attala, rose—one of the largest known; 5, Paeolus, orange. All raised by Crousse, of Nancy.
- BEONIAS*, double-flowered varieties.—1, Jeanne Majurel, purplish-red; 2, La France, rose; 3, Dr. Feltz, deep red; 4, Mrs. French, white; 5, Notary Dubled, cherry-red; 6, Miss White, pale rose, tinted with mauve. All raised by M. Crousse, of Nancy, and figured in *Illustration Horticole*, t. 98.
- BELLEGRIGIA SANDERREI*, *Gardenfiest*, t. 1316. —Leaves notched, serrate; panicles loose, with long crimson bracts and blue-tipped petals.
- CALANIS VERBURI* X, *Lindley*, t. 217.
- CALANIS* (MADAME ARTHUR WAREQUEE), *Illustration Horticole*, t. 95. —A dwarf fed red form of the *Souvenir de la Malmaison* Carnation.
- COBURGIA TRICHOMA*, *Revue Horticole*, 1890, p. 108.
- COFFEA LIBERICA*, *Revue Horticole*, p. 101.
- CORDESSIS TRINCTORIA*, *Garden*, t. 202.
- CROTON VARIEGATUS*, var. *MARQUIS DE GUADALUPE*, *Illustration Horticole*, t. 96.
- LYCASTE COSTATA*, *Lindley*, t. 220.
- MASDEVALLIA IGNEA*, *Lindley*, t. 219.
- ROSE* (TEA), Dr. Grill, *Garden*, January 18.

HOME CORRESPONDENCE.

IRIS SINDJARENSIS.—Mr. Dewar is unfortunate, perhaps, in having a poor form of this plant, for he says (*Gardeners' Chronicle*, March 22, p. 364), "although not deserving a very high place as a garden plant, it may be called passable." Now the opinion I formed of this plant in Professor Foster's garden was a much higher one; I thought it one of the prettiest and most charming of the newer Irises, but evidently, from the figure given in the *Gardeners' Chronicle* (fig. 55), there is a decided difference between the two plants. The plant I saw would be described, I think, as somewhat stately in habit, as bearing decidedly handsome foliage, and as bearing flowers of good form, charmingly coloured. The flower illustrated in the *Gardeners' Chronicle* appears thin and poor in comparison. Mr. Dewar does not give dimensions, but the flower of Professor Foster's plant was 3 inches across, with falls 1 inch wide in front of the standard and considerable widening above the claw, and here is a striking contrast with the figure, for these widened bases of the blade not only gathered up on each side of the styles, but imbricated with one another, leaving below, and above each one of the spreading standards, a well-formed window-like opening, pointed at the top and bottom. Further, it may be said of form that the falls were rounded at the apex, and not pointed, as in the figure. The recurring portion of the fall was decidedly ample, the standards were spreading horizontally, and in shape more nearly obovate, and less spatulate than is shown of the Kew plant. The coloration of the flower was by no means the least attractive feature. The standards, I believe, were of uniform deep blue, but looking down on the flower it seemed to be deep blue in the centre, imperceptibly shading off to the circumference in the almost pure white of the recurring portion of the falls, there with just enough, perhaps, of blue to make the white still whiter. The plant is described as being half a foot in height, but this one was of twice that stature. L.

My friend, Mr. Dewar, must not prematurely disparage this Iris. The plants collected by Mr. Max Leichtlin vary not only in the size, but to some extent in the colour, and, indeed, if fig. 55 is correctly drawn, in the form of the flowers. I have now in a bed, but under glass, a plant in bloom with very fine large flowers, which, though not gaudy, are very pleasing to the eye, the pale yellow of the blade of the fall harmonising agreeably with the delicate blue of the rest of the flower. The delicate perfume of the flowers, not far removed from that of Vanilla, is in itself an acquisition. The plant probably will never be very popular, but will be welcomed by those who appreciate an early spring flower of unpretending beauty. I have as yet no plants fully exposed in the open, but I believe the species will prove hardy, though the luxuriant leaf foliage will run the risk of being damaged by wind and snow. It must be remembered that the plant will probably in the future not flower so early as it has done this year. Its nearest ally is *I. fumosa*, which flowers earlier, and which, in my hands, has unfortunately succumbed to the English, or, at least, Sheldford climate. *I. orchioides* and *I. caucasica* are not far removed, but *I. palestina* and *I. Stocksi* seem to me a considerable way off. M. Foster, *Sheldford*, March 22.

SPIRÆAS FOR FORCING.—Those who require a large quantity of cut flowers should obtain the new *Spiræa astilboides* sent out by Mr. Bull. It is a useful decorative plant when well grown, and, as is often the case with Japanese plants, it lasts a long time in bloom, if not forced too hard. Many of the *Spiræas* force well if given plenty of time, and are fine plants for large houses or the cool conservatory. They seem to do best if placed in a fruit-house just started, and if brought on slowly there, they will last for many weeks. *Spiræas* require considerable quantities of water when the plants have filled their pots with roots, and are growing vigorously. It is a good plan to stand the pots in shallow pans when coming into flower, as they then last longer. *S. astilboides* is a graceful plant, and will in time become plentiful, as it follows in point of date the older *S. japonica*. Plenty of liquid-manure is required when in active growth—say at each alternate watering. Another useful *Spiræa* for later forcing is *palmata*, a now well-known species, and one that forces well if not given too much heat. The flowers are of a much higher colour, if forcing is gradual.

I have grown this species for some time to succeed *S. japonica*, and find that it is very effective if grown well. *S. japonica* *antio-reticulata* is a dwarf variety, useful for pot culture, and for using in the front rows of plants on stages or for small beds. It is the more useful where only small pots may be employed, as it does not make much growth. It should be treated like the others after flowering is over; that is, dividing the roots, and planting the pieces out-of-doors in a good compost in a warm border. If a year's rest in the border can be given the plants, they are greatly benefited thereby. *S. confusa* is another nice plant of stronger growing than any of the above. It is as easily forced as they, and is equally good for cut blooms. The plants require a light and airy place when in bloom with abundance of moisture at the roots. *S. Thunbergii* should also get a place in this collection of useful *Spiræas*, as it forces freely, and for large houses it is very effective. It is not so much grown as the others, but as it becomes better known, it will, I believe, be a favourite plant. Treatment like the rest. G. Waples, *Syon House*.

DAFFODIL SIR WATKIN.—Mr. Wolley Dod gives an interesting history of the early days of this *Daffodil* (p. 355); but it seems to me so utterly improbable, that I hesitate to accept it as being founded on fact. John Bright used to say that early Roman history was a tissue of fables, which the wise had agreed upon to believe. Let us be careful, therefore, how we make history in our own time. Here we are told that, so far back as the first decade of the present century—1800-1810—a mining Captain Byers, brought the Sir Watkin bulbs from Bideford, in Devon, to Merionethshire, and we may gather from this that it was a well-known flower in Devonshire at that early date—eighty years ago! What were the Veitchs of Exeter and the Kelways of Langport about not to find out so great a treasure earlier, whilst it was thus growing almost at their doors? Next it appears that Capt. Byers died at Dolgelly about 1845, and that there were then plenty of these *Daffodils* in cottage gardens, near Dinas Mawddly. We may infer that this information has been gleaned from rustic sources, in 1889, forty years after the decease of Byers, and eighty years after the exit of the plant from Devonshire. I think we must, for the present, treat this as one of John Bright's fables, based on Westmen's gossip. Perhaps some of your Devonshire readers will make enquiries about Bideford and endeavour to learn if Captain Byers was a reality or a myth, and if Sir Watkin blooms unknown in any old world garden thereabouts. It is, however, true enough that the Sir Watkin *Daffodil* is a very old stager, and the wonder is that it remained so long unknown to the bulb merchants. Mr. Pickstone deserves the credit of its practical discovery, although he cannot claim to be its raiser. But for him it would probably have still lain unknown to the *Daffodil* Conference. The history of its introduction to commerce by Mr. Pickstone, taken down mainly from his own recital, is to be found in *Gardeners' Chronicle*, April 26, 1884, p. 553, &c. The flower was figured in the same number, from a sketch supplied by Mr. Wolley Dod, and the plate there given may be compared with the illustration in Hale's *Ellen*, pl. H, to be referred to hereafter. Mr. Wolley Dod now gives us the history of the purchase of the bulb stocks by Messrs. Dickson, which brings the commercial history down to the present time, although the narrative does not commence at the very beginning. After Mr. Pickstone had made his large sale to Messrs. Dickson, it transpired that there were a great many bulbs in other gardens. Several communications reached me, and I sent a note to the *Garden*, October 25, 1884, pointing out that Sir Watkin was far older than Mr. Pickstone's finding of fifteen years ago, and that the bulbs were far more plentiful now than anyone knew at the time of Messrs. Dickson's purchase. That the very high price at which the bulbs were selling had stimulated enquiries, and that many thousands of bulbs would be forthcoming, believed to be the same *Daffodil*, from the mountain districts of Wales. This, it will now be noted, Messrs. Dickson afterwards found to be the case. I then went on to say: "I am told that the *Daffodil* has been known in Wales for forty years, as the Giant or Mountain *Daffodil*. But the evidence goes further back than this. In Hale's *Ellen*, 1st edition, 1757, and also in Hill's *Ellen*, 1773, this large form of *N. incomparabilis* is figured, plate 41. The diameter of the flower is 4 inches, and the height stated to be 2 feet. It is described (p. 481) in both

volumes as follows:—"The Nonpareil *Daffodil*: It was early distinguished by writers on plants, and obtained from its great size and fine coloring very honourable names—the Incomparable, the Nonpareil, and the Excellent *Daffodil*. The Latin authors have called it *N. maximus*, and *Omnium maximus*, and C. Rabarin, *N. latifolius pallidus* calyce amplo, the broad-leaved pale *Daffodil* with a great cup. The cup and petals are proportioned to one another, both very large. The colour in both is yellow, but the petals have the tint pale, and the cup is deeper." If anyone will compare Mr. Wolley Dod's figure with that in Hale's *Ellen*, the likeness will at once be evident. I have shown them side by side to many of our best florists, who have visited Brockhurst at *Daffodil* time, and with the actual flowers of Sir Watkin for comparison, and there can be no doubt about it. We have sundry Welsh forms of this *Daffodil* growing here, nearly as large as Sir Watkin and exactly similar, and these are from other districts, so it is evident that the plant was widely distributed in Wales. I have never heard of it in Devonshire. Wn. Brockbank, *Brockhurst, Didsbury, Manchester*, March 24, 1890.

NATIONAL CHRYSANTHEMUM SOCIETY.—May I invite the co-operation of *Chrysanthemum* growers throughout the length and breadth of the land in the effort that is now being made by the Special Committee of the National *Chrysanthemum* Society, viz., Mr. Lewis Castle, Hotham House, Merton, Surrey; Mr. George Gordon, 11, Stile Villas, Wellesley Road, Gunnersbury; and Mr. C. Ilsmann Payne (Hon. Sec.), 60, Thorne Road, London, S.W.; in the preparation of an entirely new edition of the Catalogue issued by that Society. The Society has good reason for being satisfied with its last Catalogue—that of 1888—both in regard to its acknowledged advantages of classification and general information, and also the sale of the same, which has considerably more than balanced the cost incurred; but it desires that the new edition should be even more complete, several fresh features being added. To this end I venture to ask for space for this note, in the hope that many who are interested in the work of the National *Chrysanthemum* Society will lend us their assistance, by offering suggestions, and specially by affording any information as to synonyms of varieties, and by pointing out errors either of omission or commission in the previous editions. Such information will be welcomed by either of the gentlemen forming the committee, or by W. Holmes, *First-union Park Nurseries, Hucknvy, London*.

EARLINESS OF ASPARAGUS.—In raking down my *Asparagus* beds, a day or two since, it was found that the mild season had started the plants into growth, and on the sides of the beds several heads were noticed that stood 1½ inches out of the soil. This forwardness of growth renders care necessary in raking the soil down into the alleys. W. L., *Bath*.

A NICE POINT.—On the occasion of the recent annual meeting of the National *Chrysanthemum* Society, exception was taken to one of the auditors acting in that capacity on the ground that at the meeting of the General Committee in December he had been appointed a member of the latter body, the rules distinctly stating that the accounts are to be audited by two persons not being members of the committee; and the accounts, therefore, had been audited by a member of the committee. It was argued on the other side—first, that the gentleman in question was not a *bona fide* member of the committee until the minutes recording his election had been confirmed at the following meeting of the committee, the accounts having been audited in the meantime; secondly, that the audit had taken place before the auditor elected to the committee in December had taken his seat; thirdly, that the appointment of auditors rested solely with the annual general meeting. Great exception was taken to the chairman's ruling as to the necessary confirmation of the election of the auditor to the committee. The matter in dispute led to the examination of precedents, and it has transpired there is an Act of Parliament in existence bearing upon this point. This Act recites, firstly, that minutes should be confirmed as to their accuracy of entry; secondly, that they should be confirmed and adopted as to their desirability and legality; thirdly, that no business is valid until the adoption and confirmation of business done at previous meeting at a succeeding one. In the face of this, it appears obvious that the chairman of the annual meeting was correct as to his ruling, and

that the auditor elected on the committee had not had his election consummated at the time he audited the accounts, the minutes of the committee setting forth his election not having been confirmed in the manner required by the Act of Parliament. This narration appears to indicate a matter of some importance, and I hope you will give it a place in your columns. *R. D.*

CAMELIAS AT CHISWICK HOUSE.—Here at the residence of the Marquis of Bute, in a structure 300 feet in length, is, at the present time, a fine display of flower—in old-fashioned varieties—of this beautiful decorative shrub, huge bushes that tower upwards, and will soon require cutting down, or increased height of roof to the house. Monarch is very conspicuous with its large vivid scarlet flowers and fine foliage. Lady Grafton, rich red flowers of great substance; Mr. May, the gardener here, highly recommends this variety as a good traveller. Chandleri-elegans is a fine light rose flower. Of the old alba-plena, there are several good trees—the collection is indeed rich in fine whites. A most curious flower is franco-frutescens (Waratah?), blossoms deep red, the petals in the centre being tightly rolled together, giving the flower quite a distinctive appearance. Amongst other good sorts noted in flower were atro-rubens, picturata, Lombardi, fimbriata, imbricata, Anemone flora elegans, and Woodsi, the last named is a very early red flowering variety. *B.*

THORPE PERROW.—The well-known gardens of Sir F. Millbank, at Thorpe Perrow, possess at the present time great attractions in spring bedding, the beds being bright with Crocus and Scilla, the latter as an edging plant in general use. They will shortly be ablaze with Tulips, Hyacinths, Polyanthus, and other plants, giving promise of as fine a display as that of last year. A walk round the garden shows many fine Conifers, which have been planted by Mr. Culverwell, the gardener, for thirty or forty years. A notable specimen is *Picea nobilis*, given to him by the late Dr. Lindley when it was in a small pot. The fruit trees are in a healthy state, their flower buds prominent for the season, and if the spring will be a genial one, Peaches will flower freely. At Thorpe, a young gardener finds much to admire and interest, and a longer stay than was possible on this occasion would have been to my advantage. *J. J. Brown.*

THE CLEMATIS. Mr. Jackman has done well to call attention to the Clematis, and its great usefulness. It seems to me that it is a subject that does not receive so much attention as it really deserves. I am particularly anxious to call attention to the group of patens, or early-flowering Clematises. They are numerous, and generally very free, and varied in beauty; but the great difficulty besetting this group is to make gardeners understand the essential difference between the pruning required for the spring flowering and the summer-blooming types. Not long since I was in a garden where some varieties of Clematises—the spring and summer bloomers being among them—are grown, and I found the gardener had cut them all back, patens and Jackmanii types, with the result that all the bloom from the latter is lost for the season. He frankly stated that he did not know any difference between them, and therefore he treated them alike; and yet it is not difficult to discriminate between the two, for the spring bloomers are mostly of less robust growth, and in early spring form plump buds where they will blossom, and these are plentifully found on ripened wood of well managed and established plants. The summer blooming varieties, when they start into growth in early spring, put forth shoots at the points of the old wood, which soon elongate, and at that stage there is no sign of flower buds. Thus, there are two main differences which are soon recognised and understood by those who have a collection of spring and summer blooming varieties under their care. I venture to add two others to the selection of patens varieties given by Mr. Jackman, viz., Duke of Edinburgh and Mrs. S. C. Baker. And I am pleased to see him giving a prominent place to a very old favourite of mine in this group. I mean Miss Bateman, white, a variety remarkably free to flower, with stout and well-formed blossoms. Two much cannot be said in praise of *C. montana*; if any one would see this species in all its beauty in the month of May, they should make a journey to the village of Sonning, near Reading. It can be seen there on many a house, blooming gloriously. The plant appears to have quite taken root in the place, and to have become a

general favourite. Close by the river bank is a well known boating and fishing hostelry, and a very large specimen of *C. montana* covers a good portion of the walls, a good deal of the plant being under a glass verandah. Here the plant blossoms with remarkable luxuriance, and it is worthy a journey of miles to see it. It appears to do well in this place in almost any position, but a sunny one appears to be that best adapted to bring out the chaste beauty of this valuable and effective species. *R. D.*

FIG. 59. MALPIGHI-ORANGE (SETIA PELTATA).

SETTING THE BLOSSOMS OF PEACHES AND NECTARINES.

—In his note, p. 331, Mr. Sheppard appears to condemn the practice of tickling the blooms of Peaches and Nectarines with rabbits' tails as being unnecessary, he finding that a good set may always be procured without this tedious performance. I agree with Mr. Sheppard, providing there is much more bloom than is required for a good crop. But what about such shy-bearing varieties as Waterloo, Stump the World, and Noblesse Peaches?—the latter, that is very prone to drop its buds. Would Mr. Sheppard condemn the tickling of their flowers? if so I fear the crop would sometimes be a very scanty one. I have never failed to secure an abundant set of these fruits, but I am always delighted to see the bees about the trees, carrying as they do the pollen from flower to flower; but when there are no bees about in the blooming time, I take the precaution of distributing the pollen by some other means. *A. Bishop.*

FIG. 60. MALPIGHI-ORANGE (SETIA PELTATA).

CENTROPOGON LUCYANUS.—As a winter flowering, showy plant, of easy cultivation, Centropogon Lucyanus should not fail where winter flowers are in request. The first blooms are terminal, but when these are removed, bloom issues from every lateral shoot, and affords a long succession. The milky juice of the plant may be got rid of in cut blooms for the coat, by cutting them a short time before they are wanted, and laying them in a pan of water. To propagate this plant, young shoots taken from the stems, about 3 inches long, and with a heel, strike readily in brick heat, under a bell-glass, or in a propagating-box, or hand-light. Pot off when struck, and keep them close and moist for a short

time, afterwards placing them on a shelf near the glass, with a temperature of from 60° to 70, and in this position they may remain till June; but after that period a pit or frame will meet their requirements, provided the lights are closed early in the afternoon, the plants freely syringed to keep the leaves healthy. Early in the autumn the plants should be placed in the stove in a light situation, and occasionally weak liquid manure may be substituted for clean water in watering them. The soil most suitable to grow Centropogon Lucyanus are loam and peat of equal parts, with enough sand to keep it open. Old plants may be cut back, and when they break shewn out and repotted. These old plants make fine specimens, fresh growth issuing freely from the crowns. *J. S.*

THE FLOWERING ASH.—We have growing here a similar specimen of this rare tree to the one mentioned by Mr. Webster in last week's *Gardeners' Chronicle*, and when in flower it merits the praise given to it. I have for years tried to obtain seed from it, but have failed to do so. The tree appears to be grafted about 2 feet above ground. *H. Lindsay, Hantsford Park.*

WINTER FLOWERING PLANTS AT COLWYN BAY.

—Among shrubs which have shown an unexpected power of adapting themselves to a different climate, may certainly be mentioned *Cytisus racemosus*. Some four or five years ago, I planted out two or three plants here as an experiment. These have grown into bushes about 8 feet high and 10 feet in diameter, and have been flowering continuously and abundantly since November. A bush in front of my window as I write is now a mass of golden-yellow and deliciously fragrant blossoms. The spikes of flowers are much longer than on pot plants, and do not seem to be in the least injured by a temperature of 25° in a Stevenson case, which is the lowest registered this year. I am strongly inclined to think that this shrub is much harder than is commonly supposed, and as it is, in my opinion, unquestionably the most valuable flowering shrub we possess, from its free, long-lasting, and (in mild seasons) winter blooming habit, it is certainly worth a trial in every tolerably warm garden with a stony soil. The following list of shrubs and plants which were in flower here in January last may interest your readers, as showing the extreme mildness of this climate. I may mention that all the shrubs have been planted for some years. Among the trees which were not in bloom there are five species of *Eucalyptus*, three of which—viz, *E. globulus*, *E. viminalis*, and *E. coriacea*—are 25 feet high. The scarlet *Habrothamnus*, on a N.E. wall, has survived the last two winters unprotected: *Shrubs*. *Roses*, tea and hybrid perpetual, *Veronica imperialis*, *V. pavillora*, *V. elliptica*, *V. blue* gem, *Destotainaea spinosa*, *Fuchsia microphylla*, *Lonicera fragrantissima*, *Berberis japonica*, *B. Darwini*, *Pittosporum Tobira*; *Viburnum tinus* (Laurentinus), *Arbutus uniflorifolia*, *A. unedo*, *Escallonia macrantha* and other species, *Choisya ternata*, *Grevillea rosmarinifolia*, *Cistus monpellierensis*. *Plants*.—*Doronicum plantagineum*, *Oxentilla albidus*, *P. Hopwoodiana*, *Schizostylis coccinea*, *Aubrieta Eyrei*, *Cheiranthus nutabilis*, *Erigeron mucronatus*, *Horis gibbaltaria* hybrid, *L. sempervirens*, *Erodium hyme-nodes*, *Chrysanthemum indicum* var. *C. coronaria* var., *Vinca*, major and minor, *Campanula muralis*, *Dianthus Seguieri*, var. *collinus*; *Heilbornis niger*, *H. colechicus*. Also abundance of *Stocks*, *Wall-flowers*, *Viols*, *Primroses* (double and single), *Snodwops*, *Mignonette*, *zonale* *Pelargonium*, &c. *Alexd. O. Walker, Saint-y-Glyn, Colwyn Bay, January 12.*

LILIES IN TUBS.—It is interesting as showing the way in which able gardeners can differ who are situated in diverse districts and operating in diverse soils, that Mr. Elwes on the one hand, Mr. Ingram on the other, should hold such diverse opinions respecting the merits of planting roots in tubs in the garden borders as advised by Mr. Wilson. That gentleman, whose remarkable success at Wisley in what he undertakes shows that his experiments have undoubted merit in them, evidently regards the roots of trees and shrubs in the flower borders as comorants, only too ready and certain, if not prevented, of eating up the sustenance of everything else. I will venture to say, that if the soil immediately round those Lily tubs at Wisley could be examined, it would be found that almost a wall of grossly hungry fibre had been formed eagerly anxious to prey upon the soil within, which for the time, at

least, the tubs so effectually safeguard. Practically the tub system is but another method of sinking or plunging plants into the borders in pots. A more kindly view of the action of predatory shrub roots than Mr. Elwes exhibits can hardly be conceived; it is so kind of them to rush in and carry off the superfluous moisture in hot weather, and the excessive nutriment from soil already too liberally exhausted. Of course, there are roots and roots, for some are madly hungering after all possible nutriment, and run all over the borders like lions seeking for prey; others never get far from home, and are content with a limited radius. Mr. Elwes probably thinks of the latter; Mr. Wilson of the former. Both are doubtless right in a certain sense, but, on the whole, the latter shows the most practical wisdom in determining to keep all marauding roots at bay. A. D.

SOCIETIES.

ROYAL HORTICULTURAL.

The last meeting of the above Society, held in the Drill Hall of the London Scottish Volunteers, James Street, Westminster, on the 25th inst., brought a large number of trade exhibits, consisting of Clivias, Narcissi, pot Roses, forced Lilac, and Cinerarias, together with an interesting collection of Orchids from private growers and nurseries. Visitors arrived in considerable numbers towards three o'clock, at which hour M. de Vilmorin commenced the reading of his capital paper on Salads.

Floral Committee.

Present: H. Marshall, Esq., in the chair, and Messrs. R. Dean, A. Truffaut, G. Paul, H. Herbst, B. Wynne, T. Baines, C. T. Druery, Ch. Jeffries, J. Walker, F. Ross, H. Turner, W. C. Leach, R. B. Lowe, H. H. D'Ombraun, J. Fraser, H. Cannell, W. Holmes, and L. Castle.

An extensive collection of plants was staged by Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N. A number of finely grown Clivias were included, a specimen of *Ambrosia Verschaffeltii* being very noticeable on account of its large number of flowers as well as the size and depth of colouring of the individual blooms. *Martha Reimers* was also well shown. Forced Lilac, the varieties being *Charles X.*, *alba marginata*, and *Persian* were represented by well-flowered specimens, and of the *Gueldris Rose* there were also several forced plants in pots. There was, moreover, a collection of about one hundred *Hyacinthus* of fair quality, the varieties including such well known favourites as *King of the Blues*, *Lord Derby*, *Marchioness of Lorne*, *Roi des Belges*, *Luna*, *Mimosa*, and *Von Schiller*. Half-a-dozen pots of *Lily of the Valley*, very evenly and nicely flowered, several of *Boronia megastigma*, and one plant of *Epiphyllum Russellianum* Gaertneri, with a profusion of rich red flowers completed this large collection, which filled one side of the centre table.

From Messrs. Paul & Son, Old Nurseries, Chesham, N., came a group of pot Roses, very well grown, and having a nice lot of flowers. There were, among others, *Souvenir de S. A. Prince*, which is one of the best of recent introductions, and, as shown, superior to *The Paritan* and *The Bride*, which were also exhibited; *Caroline d'Arden*, a fine bright flower; *Marquise de Castellane*, *alba rosea*, *Comte de Paris*, *Baron W. de Rothschild*; and of smaller-flowered sorts, *Mignonette*, *Clotilde Soupert*, and the single *grandiflora*.

A few interesting alpinines were contributed from the Royal Gardens, Kew, which included *Saxifraga oppositifolia*, *S. splendens*, *S. Boydii*, *S. arcticoides* *plicata*, *Primula denticulata*, *P. d. alba*, *P. Fortunei*, *P. pubescens alba*, and a few others. There were also specimens of *Hyacinthus ciliatus*, with dud flowers of brown; *Sisyrinchium grandiflorum*, and a finely flowered *Hemantthus multiflorus*, with bright scarlet flowers.

Messrs. Wm. Cutbush & Son, Highgate, N., sent a collection of various *Epacris*, *Lady Panmure*, pure white; *Vilmorina*, rose-pink; and *Rubella*, rose, showing up well. They also had specimens of *Boronia heterophylla*.

A box of Carnations was sent by Mr. C. Turner, Royal Nurseries, Slough, in which was a handsome flower of a very fine dark crimson, variety named *Lord Rothschild*. A striking flower too was seen in

novelty state with carmine flakes, and is by no means unattractive.

Primroses in a variety of colour were shown by Mr. R. Dean, Ealing, W., who also had *Bedford Yellow Wallflower* a very serviceable variety, of dwarf habit; and a violet self *Auricula*, suggestively named *Violetta*—it has a good deep colour and a heavy paste.

Messrs. H. Cannell & Sons, Swanley, Kent, had a collection of cut trusses of their zonal *Pelargoniums* brilliantly coloured and the pips large, also a few double *Cinerarias*, altogether a very showy display.

Mr. G. W. Cummins, gr. to A. H. Smee, Esq., The Grange, Wallington, sent two pots of *Veltheimia viridifolia* with flowers of dull coral-red, spotted with yellowish-white, the leaves shiny green.

Philadelphus inodorus was sent by Mr. W. C. Leach, Albury Park Gardens, Guildford, who recommended it for forcing purposes, its scentless white flowers are very pretty, and the plant itself attains a height of about 6 feet, the same exhibitor also sent flowering branches of *Dautzia candidissima* fl.-pl. with very showy large sized flowers.

From Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, S.W., were some few specimens of *Trillium discolor atratum*, the flowers being deep purple-brown, and the sessile leaves dull green mottled with a lighter shade. A few *Hyacinthus* were also sent, of which *Bouquet blanc*, a pure white single variety was a fine one with large pips and solid spike. Admirable is pink with a darker centre nerve, and *Fleur de Paradis*, a rich cream-coloured variety, both of which are singles.

A considerable number of varieties of *Daffodils* were contributed by Messrs. Barr & Son, 12, King Street, Covent Garden, W.C., which embraced several of the best known forms, a relief to the mass of yellow being given by an edging of *Anemone fulgens*, various *Scillas*, &c. *Iris Sindjarenis*, which was the subject of an illustration in our last issue, where full particulars of this plant will be found, was also sent by Messrs. Barr.

Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, sent under the name of *Pteris Harrisoni* a pretty Fern with the fertile fronds some 13 inches long pinnæ at the top, bi- or tripinnate at the base, the pinnæ being long and narrow, dark green with a comparatively wide toothed band of white in the centre, very decorative.

Mr. T. H. Froud, gr. to J. W. Ford, Esq., Chase Park, Enfield, N., sent a collection of cut *Camellias*, including *Donkesterli*, *alba plena*, *Corallina*, *Chandleri elegans*, *Marchioness of Lorne*, &c., and also sprays of *Acacia retinoides*.

A fine-growing vigorous form of *Lily of the Valley* was sent by Mr. E. Morse, Ascot Nurseries, Epsom, under the name of *Fortin's variety*. The bells were very large, and bore about fifteen or sixteen on a spray. The leaves were also remarkably broad and richly coloured.

A showy lot of *Cinerarias* was sent by Mr. J. James, Woodside, Farnham Royal, and showed his strains to be of nice dwarf habit, and possessing several good colours.

Orchid Committee.

Present: Sir Trevor Lawrence, in the chair, and Messrs. S. Courtauld, T. B. Heywood, H. M. Pollett, H. Balderson, H. Bullantine, J. Domyng, Ch. Pilcher, E. Hill, H. Williams, L. Castle, P. Moore, F. G. Tautz, A. H. Smee, James O'Brien, and Dr. M. T. Masters.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, S.W., sent a charming new hybrid *Laelia Cattleya Hypolyte*, the result of fertilising *Laelia cinnabarina* by the pollen of *Cattleya Mossio*. The resulting plant is fairly intermediate in all its parts, and the flower, which displays a most beautiful rich Indian yellow colour, is about 5 inches across, the lip closes over the column, and is slightly tinged with madder on the median lobe, which is somewhat undulate; the petals are ovate-acute, with a slightly serrated margin, the sepals being lanceolate. The foliage was also of an intermediate character.

Messrs. F. Sander & Co., St. Albans, contributed a few good specimen plants, having a well-flowered example of *Dendrobium nobile nobilis*, *Mitonia vexillaria*, *St. Albans variety*, with large richly-coloured flowers; and of *Oncidium bifolium majus* also *Angraecum Germanianum*, with a delicate white flower; *Oncidium tetrapetalum*; the finely-lipped *Cattleya Triane var. marginata*, referred to in the report of the last show; *C. T. vivicans*, a form with lightly-tinged petals, and a deeply-coloured lip of

moderate dimensions; and *Phaius Cooksoni*, shown at the last meeting, and described on p. 388 of this issue (see also fig. 57, p. 389). *Phalaenopsis Schilleriana gloriosa*, the petals and sepals being white, with a tinge of rosy-mauve down the centre, and spots of brown on the lip, was sent by Messrs. H. Low & Co.

Several fine Orchids were shown by F. G. Tautz, Esq., Studley House, Hammersmith, gr. Mr. Crowley. These consisted of *Cattleya Triane Tautziana*, in which the lip is a beautiful feature, deep in colour, and regularly frilled; *Dendrobium chrysolidum*, *Lycaste cruenta*, a plant of two shades of yellow, and purple stripes in the throat; *D. Freemanii*, a form of *D. nobile*, with white margin to the lip, and a patch of deep purple colour in the throat; *Odontoglossum Blandianum*, a plant carrying two spikes.

From A. H. Smee, Esq., The Grange, Wallington (gr. Mr. Cummins), came two large plants of *Cyrtopodium Saintlegerianum*, figured in our pages, August 18, 1888, and Certificated by the Royal Horticultural Society, March 3, 1888.

Mr. Ballantine, Baron Schroder's gardener, The Dell, Egham, exhibited *Baron Schroder's variety* of *Dendrobium Wardianum*, in which all the segments of the blossom are white, but the points which are bright purple colour, and the interior of the throat as in the type; *Odontoglossum Lecanum*, a well-developed spike of this showy Orchid; *Cattleya Triane Schroderi alba*, white, all but the upper interior part of the throat, which is yellow. The plant bore two flowers.

A small well-flowered *Dendrobium nobile* was shown by H. F. Nalder, Esq., Mornington Lodge, West Kensington.

Messrs. Pitcher & Maude, United States Nursery, Hextable, Swanley, showed a collection of new *Cyrtopodiums*, including *Chlorops*, a greenish flower, and continuous flowerer, *Buxalli superbum* and *B. atratum*, *Dautheri*, &c.

A finely grown *Angraecum citratum*, shown as *var. gigantea*, was sent by Mr. G. Elliott, gr. to W. F. Elliott, Devonshire House, Stamford Hill, N., the plant bore four large spikes of well-developed flowers, and made a good display. *Oncidium sarcodeum* in a good specimen, came from W. C. Walton, Esq., Percy Lodge, Winchmore Hill (gr. Mr. G. Cragg). Mr. T. A. Glover, gr. to E. Ellis, Esq., Manor House, Wallington, sent a good form of *Odontoglossum Andersonianum*, with large flowers heavily spotted, also blooms of *Lycaste Schilleriana*, and *Dendrobium nobile*.

A hybrid *Cyrtopodium* named *C. hybridum Poyntzianum*, came from R. Young, Esq., Linnet, Liverpool; it was a small flower, the dorsal sepals apple green, with darker lines, the petals dull rose on the apical, half greenish at the base with a few conspicuous brown spots, lip pale brown fading to a yellowish hue at the bottom of the pouch.

Mr. C. J. Catt, gr. to J. C. Parr, Esq., Grappenhall, Hayes, Warrington, sent blooms of a large form of *Angraecum sesquipedale*.

Fruit Committee.

Present: Sir C. Strickland, Bart., in the chair; and Messrs. H. de Vilmorin, P. Crowley, R. D. Blackmore, H. Weir, J. Chell, Ch. Ross, G. W. Cummins, J. Smith, J. Willard, W. Warren, J. Wright, A. H. Pearson, G. Wythes, J. Hudson, F. Q. Lane, H. Balderson, G. Bunyard, Arthur Sutton, R. Hogg, A. Watkins, T. F. Rivers, and Arnold Moss.

Mr. Charles Ross, Welford Park Gardens, Newbury, sent a new seedling Apple named *Armour*, which is a small fruit of a yellow-brown colour, somewhat broader than deep. The flesh is said to be rather hard. From W. Roupell, Esq., Harvey Lodge, Roupell Park, S.E., came some well-kept fruits of *Annie Elizabeth*, *Melon*, *Bismarck*, and *Striped Beefe*, all of which were quite plump. A box of fine fruits of *La Grosse Sucré* Strawberry was sent by Mr. J. Simms, gr. to W. Eastwood, Esq., Kingswood, Englefield Green. They were very fine fruits. Specimens of *Lockie's Perfection* and *Sutton's Telegraph Cucumbers* were sent by Mr. Lockie, Oakley Court, Windsor; and Mr. J. Smith, Mentmore Gardens, Tring; also had a brace of Cucumbers, *Balls of James' Prize Keeping Onion*, a moderate sized long-shaped bulb, with a pale brown skin, was sent by Messrs. Rutley & Silverylock, Savoy Street, Strand, W.C.; and from Mr. W. C. Leach, Albury Park Gardens, Guildford, were heads of *Veitch's Standard Bearer Celery*, which was said to be very hardy, it evidently blanches well, and is very sweet.

The awards made will appear in our next issue.

ROYAL BOTANIC.

MARCH 26.—The first spring show was held in the gardens at Regent's Park, on Wednesday last, when the weather proved very favourable. Exhibits were chiefly from nurserymen.

Messrs. H. Williams & Son, Fortis Green, Finchley, were successful exhibitors, and won prizes for Narcissi, Tulips, Hyacinths, Lily of the Valley, and Primulas, and showed a good lot of plants in all these classes.

In the Amateurs' classes, Mr. J. Douglas, Great Gearys, Hford, stood well, leading for Hyacinths, Tulips, and Crocuses, the last named being very good. The same exhibitor also won first for six *Doutzias*, showing well-flowered and large specimens.

Mr. Eason, gardener to B. Noakes, Esq., Hlope Cottage, Highgate, was first for a nice lot of six *Azaleas*, in the amateurs' class, while Mr. R. Wills, Longton Nursery, Sydnam, had the best six in the nurserymen's section, both of these classes showing a little improvement on last year's style.

Messrs. Paul & Son, The Old Nurseries, Cheshunt, had a pretty lot of *Amaryllis*, and won first in the class for twelve, with strong plants, Alton Locke, carmine, with a white nerve, being one of the best. The same firm was also placed first for a collection of *Roses*, showing a nicely grown and well-flowered lot in which *Alba Rosa*, *Souvenir de S. A. Prince*, and *Caroline d'Arden* were seen. Again for a collection of hardy herbaceous plants, as well as for bulbous plants, Messrs. Paul & Son were placed first, having a good representative collection, including *Saxifragas*, *Primulas*, *Iris reticulata*, *Erythronium*, *Bus canis major*, *Tulipa Kaufmanniana*, white segments, with orange yellow base, bearing a distinct red spot at the top of the yellow colouring. Mr. Phillips, of Langley Broom, Slough, had some fine *Cyclamens*, and was placed first for them in two classes.

Among the miscellaneous collections was a group of *Heacaths*, *Narcissi*, *Viburnum opulus*, *Amaryllis* and *Clivias*, including *Metvor*, a variety with short set flowers, and a compact head from Messrs. R. S. Williams & Son, Upper Holloway, N. (Large Silver Medal). Messrs. H. Williams & Son sent a lot of about a hundred nicely grown *Hyacinths* and other plants, for which a Silver Medal was awarded. Messrs. Barr & Son, Covent Garden, and Mr. T. S. Ware each sent a bank of *Narcissi* of the usual character, for which large Bronze Medals were given. Small Silver Medals were given for a collection of *Cyclamen*, which had the Duke of Fife, from the St. George's Nursery Co., Hanwell, to Mr. J. James for *Cinerarias*, in which was *Gem*, blue, with a white inner zone; to Messrs. W. Paul & Son, Waltham Cross, for a collection of *Camellia* blooms in well-known varieties; to Messrs J. Laing & Son, for a group of miscellaneous plants, in which were *Orchids*, *Azaleas*, and *Clivias*, including the variety *Stained Beauty*, pale salmon-red; and to Messrs. Paul & Son, for a nice lot of *not Roses*. And Bronze Medals went to Messrs. H. Cannell & Sons, Swanley, Kent, for zonal *Pelargoniums* and double *Cinerarias*; and to Messrs. W. Cutbush & Son, for a collection of *Eupacris*, *Azaleas*, *Acacia grandis*, &c. Mr. Odell, Gould's Green, Hillingdon, also sent a nice lot of *Cyclamen*.

The Certificates given will appear next week.

NOTICES OF BOOKS.

THE CULTIVATED ORANGES AND LEMONS OF INDIA AND CEYLON. . . with researches into their origin and the derivation of their names . . . with an atlas of illustrations. By E. Bonavia, M.D. (W. H. Allen & Co., Waterloo Place.)

We are told in the preface to this book that its subject matter is not confined to Oranges and Lemons, but comprises all varieties of Citrus. It was originally begun with the object of showing how many varieties might be advantageously cultivated in India, for the sake of their fruit, or for preserving purposes, or the manufacture of citric acid.

In the course of his researches into the cultivated fruits, the author found his materials increasing, not only in bulk but in variety, and in consequence his book has a wider scope than was originally intended. The author has had the opportunity of seeing and

handling a larger number of forms than any of his predecessors, and he has been at the pains of giving outline illustrations of their foliage and fruit, rarely of their flowers or seeds. These drawings are, as he says, rough, but they are all to scale; every botanist will admit that they are more serviceable for his purposes than the elaborately-finished or artistically-drawn flowers, which are supposed to represent what the artist sees, and nothing else. As the artist generally sees but little, and that little very imperfectly (of course we are speaking from a botanical point of view only), his effective and pretty sketches are generally useless. This cannot be said of Dr. Bonavia's sketches, they are merely the rough memoranda of a botanist; but they represent the peculiarities and variations of all the forms known in India, and as such they have permanent value.

Dr. Bonavia suggests that Orange growers in India and Ceylon, with their command of cheap labour, might advantageously compete in the London markets with the growers in Florida and their dear labour. He estimates labour in India as tenfold less costly than in Florida, where, moreover, frosts occasionally occur. He shows that one of the best *Pummeles* is to be found in Bombay; that *Tanjore* possesses the best *Portugal Orange* in India; that the sweetest Orange to be had in the world grows semi-wild on the borders of *Nepal*; that in the *Punjab* and *North West India*, blood oranges are grown; that *Almora* possesses a *Citron* from which candied peel can be made better than that from *Leghorn*; that the *Malta*, *Portugal*, or *Sicilian Lemon* can be grown all over *India* and *Ceylon*, and that they are efficient remedies for intermittent fever and enlarged spleen. Dr. Bonavia proceeds to give in successive chapters an account of the several "groups" of Oranges, Citrons, Limes, and Lemons, embodying the results of much research, literary, philological, historical, and botanical. To show how variable are the plants of this genus, the author tells us that it is sometimes difficult to decide which is an Orange, which a *Pummele*, and which a *Lemon* or *Citron*: This would seem to indicate long cultivation and extensive interbreeding, and yet there is evidence to show that in some cases, at least, cross-fertilisation is uncommon: the *Saville Orange* will not cross with the sweet, nor the *Limes* and *Lemons* with the *Orange*. The *Seville* or *bitter Orange* has been grown for ages from seed, and though perhaps originally from the same stock as the *Malta* type, is now so distinct that it refuses to cross with it. Ten chapters are devoted to the description of the several "groups," but there is a want of a general summary of the author's conclusions, and the reader has to work through a series of historical and linguistic details—of great interest, doubtless, but which are embarrassing to the student in search of the characteristics by which the groups may be distinguished one from the other.

Under the head of cultivation, the importance of a sandy soil mixed with humus, and capable of retaining a good deal of moisture, is insisted on. In the *Khasia* hills the *Orange* is grown from seed only; the seedlings are grown in the nursery for three or four years, with little care beyond the removal of weeds. When the seedlings have attained a height of 3 to 4 feet, they are planted out in their permanent quarters, about 300 trees going to the acre; jungle growth is removed every year, but neither hoeing nor harrowing, nor irrigation is required. The trees begin to bear about the sixth year, or the third from transplantation, the general average being about the eighth year. At first five to ten fruit per tree are produced, increasing for the next five years, when about 800 fruits per tree are produced, and this general average is thenceforth maintained, though not infrequently very much larger crops are yielded. The garden remains productive for from thirty to fifty years, according to the richness of the soil. It must be remembered that the *Khasia* hill climate is one of the wettest in the world, and that the cultural conditions have to be greatly modified elsewhere. In the *Azores* the *laissez faire* system has resulted in disease in the *Orange* groves, and very serious loss.

In *Nagpur* the *Orange* is propagated by budding, the sweet *Lime* being the stock used; it is evident that by this means good varieties can be propagated with much greater certainty than by seed. Mr. Ridley's remarks on the cultivation of the *Orange*, at p. 109, are too long for transcription, but they should be read by all intending cultivators; and they go to show that careful cultivation pays, whereas carelessness and neglect entail eventual ruin.

The chapter on the commercial products, and that on trade statistics, are full of information, deserving attentive consideration on the part of those concerned in the development of the agricultural resources of *India* and the *Colonies*.

The chapter on the morphology of the fruit, reveals that Dr. Bonavia's views are not at all in accordance with those of most botanists. For Dr. Bonavia the ripe pistil or fruit consists of two whorls, "the outer or rind whorl and the inner or pulp whorl." So that the rind is considered as an outer series of barren carpels enclosing the pulp or fertile carpels. It was the opinion of the elder *De Candolle*, *Organographie Végétale*, ii., p. 41 (1827), that the peel or rind was an enlargement of the disc shown in our figure of the *Kumquat* flower (fig. 58), and which grows over and encloses the carpels. It is true that in some monstrous fruits a double row of carpels is found one above the other, just as in a *Pomegranate* (see fig. 59), but this circumstance does not help Dr. Bonavia much, for the inner carpels in these cases are covered with rind as usual.

Dr. Bonavia further considers the pulp-cells to be the homologues or equivalents of the oil cells of the rind. If the latter are to be considered as referable to hair-like productions or trichomes, Dr. Bonavia's contention would be admissible, for the pulp-cells are, as was many years since shown by *Carmel*, to be modified hairs lining the inner surface of the carpels. The author indulges in further speculations; he considers the leaf of the *Citrus* to be "a modified branch; the serrations on its edges, abortive leaflets; the oil-cells in their angles, abortive buds in abortive axille; and in the normal bud, the spine, the oil-cell of the leaf and the rind, and the juice vesicles of the pulp, the pollen grains and the seed-bud would all have to be considered as homologous." We are afraid Dr. Bonavia here makes a larger drift upon the morphologist, than they will care to honour, but he candidly confesses it to be speculation, and the chapter may have its uses by stimulating further observations.

The fifteenth chapter is devoted to a discussion on the origin of the several varieties as illustrated by phology. This again is very interesting, but highly conjectural, and does not come within our scope.

A series of appendices, occupying more than 100 pages, or nearly one-half as long as the volume itself contains a great variety of interesting matter extracted from various sources, and relating to a great diversity of subjects germane to the author's main thesis. Among other things, a translation of *Rumphius'* remarks on the forms of *Citrus* in the *Herbarium Amboinense* is given; in fact, this portion of the volume is an encyclopædia of knowledge relating to the genus *Citrus*. It is unfortunate that the index is not so contrived as to render access to these varied contents easy; for instance, much is said in the body of the work about *Oranges* and *Orange-culture* in *Florida*, but the word *Florida* does not occur at all in the index under *F*, nor under the heading *cultivation*, though other countries are mentioned. Under *D*, it is true, we find *disadvantages of sojourn in Florida*. Should a new edition be called for, a good classified table of contents, and a complete index suitably constructed, would be great boons. As it is, the value of an excellent and suggestive book is marred by the provoking character of the index.

Whatever we may think of Dr. Bonavia's speculations, and of his want of symmetry and method in the arrangement of his material, there is no question that he has got together a very large amount of valuable and interesting information, and that his work will stimulate practical men to undertake and

extend the culture of Oranges and similar fruit in suitable places, and will give rise to much difference of opinion among botanists, from which much increase in knowledge, and the gradual evolution of the truth, may be anticipated.

THE WEATHER.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in "Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.	BRIGHT SUN.
	Above 42° for the Week.	ACCUMULATED					
		Day-deg.	Day-deg.	Day-deg.	10ths Inch.		
1	13	28	51	5	62	14.6	21
2	11	25	48	4	49	7.7	17
3	14	21	3	87	4	43	4.5
4	13	20	13	17	11	18	5.3
5	1	33	29	2	16	0.4	4.8
6	0	39	14	6	34	2	42
7	1	17	25	14	52	1	54
8	1	26	13	14	51	1	50
9	1	29	15	9	32	1	48
10	2	14	32	10	18	2	56
11	3	22	33	10	15	2	58
12	1	29	0	56	13	4	50

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.

Principal Grazing and Pasture Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending March 22nd, is furnished from the Meteorological Office:—

"The weather was dull and changeable, with rain almost daily, in most parts of Great Britain, but in Ireland and the Channel Islands rain was less frequent, and several bright intervals were experienced.

"The temperature has continued slightly above the mean in nearly all parts of England and Scotland; in Ireland and the south-west of England, however, it has varied from 1° to 3° below the normal value. The highest of the maxima were registered in most cases on the 18th, and ranged from 54° in England, S.W., and Ireland, N., to 60° in Scotland, E., and 62° in England, E., and Ireland, S." The lowest of the minima, which were recorded on irregular dates over Ireland and Scotland, and on the 18th at most of the English stations ranged from 24° in Ireland, N., and 25° in England, S.W., and the 'Midland Counties,' to 32° in England, N.W., and 36° in the 'Channel Islands.'

"The rainfall has been more than the mean in the north and east of Scotland, in the south of Ireland, and over the major part of England, but less in the Channel Islands, Ireland, N., England, S.W., and Scotland, W. In England, E., the excess has been very large, owing to heavy falls which occurred on Wednesday.

"Bright sunshine has been more prevalent in Ireland than it was last week; elsewhere the values do not differ materially from those which were then recorded. The percentage of the possible duration ranged from 17 in Scotland, E., to 31 in England, E., 34 in England, S.W., 41 in Ireland, and 43 in the Channel Islands."

LAW NOTES.

MENES, CARTER & Co. traverse some of Mr. Van Geert's statements, and send the original invoice to show that the route was not indicated. We can insert no more on this subject.

Obituary.

ROBERT WALKER, of Richmond, near Peterhead, Aberdeenshire, was buried on the 21st inst. The deceased was a gentleman of rare qualities in many ways, but he was particularly known as a botanist. The assistance which he rendered to the late Professor Dickie, Botany Chair, Aberdeen University, in some of his lectures, was highly appreciated and gratefully acknowledged by that famous botanist. He was also passionately fond of gardening, and his chief outdoor occupation, when not on tour through the country, was attending to his garden.

W. CAULDWELL.—We regret to announce the decease of W. Cauldwell, of "The Ives," Wantage, on the 22nd inst., at the age of sixty-eight years. He was well-known for his splendid strain of coloured Primroses, Polyanthus, &c. At one time the deceased was an occupant of a large farm, but having a love for flowers, he gave up the pursuit of farming, and purchased the land known as the Grove Nursery, to carry out his hobby. Of late years he had cultivated all the best kinds of annuals extensively for seedling purposes, and was very successful.

MARKETS.

COVENT GARDEN, March 27.

MARKET very quiet, with good supply of indoor fruit and vegetables. Grapes, although a short supply, are sufficient for the demand. James Webber, Wholesale Apple Market.

MARKETS.—Prices for old Potatoes are low, all round, and a very bad finish for them generally may be anticipated. New, mostly Channel Island Potatoes, are arriving in larger quantities; quotation 2s. to 4s. per cwt. easier. J. B. Thomas.

SEEDS.

LONDON: March 26.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report to-day's market quiet, with a small attendance. Red Clover seed continues cheap and abundant. In Alsike the advance now established is quite £10 per ton. There is no change in either white or Trefoil. For heavy perennial Ryegrasses more money is asked; French-Italian is now remarkably cheap; Timothy and Cocksfoot are dearer. For Tares there is an improved sale, available supplies are getting into narrow compass. Blue Peas steady; Rapeseed, being very scarce, is dearer; Scarlet Runner Beans offer less freely. Sanfoin finds buyers at last week's terms, this variety now more and more takes the place of natural grasses.

ENQUIRIES.

"He that questioneth naught shall learn much."—BACON.

PARIS MARKET GARDENERS AND NURSERYMEN.—Will some of your readers who know France well kindly tell me the principal market gardens and nurseries in the neighbourhood of Paris, and which are most worthy of a visit from a gardener's point of view? Henry Perkins, Greenlands, Hoxley-on-Thames.

NOTICES TO CORRESPONDENTS.

*. * Owing to the large extension of our circulation, we are under the necessity of going to press at an earlier time than heretofore, and request our regular correspondents to favour us with their communications as EARLY IN THE WEEK AS POSSIBLE.

APPLE TREES: A. P. Decapitation was not meant, but severe pruning only. The former would be preferably performed just at the fall of the leaf.

BOOKS: J. A. O. The books you require may be had of M. Nutt, foreign bookseller, Strand, London, W.C.; and Williams & Norgate, Henrietta Street, Covent Garden, W.C.—H. C. Boissier's *Flora Orientalis* is to be obtained of H. Grogg, bookseller, Bale, price 140 francs, 6 vols., or Williams & Norgate as above. Tristram's *Western Palestine* only contains a list of plants, without descriptions.

CARNATIONS SALMON-COLOURED: C. T. A. Mrs. Dodwell, rosy-salmon; Mrs. Logan, salmon-scarlet; Little Nell, rosy-salmon, fine form. We name these, still the one you saw in the North may be a different flower.

CROTONS PROPAGATED BY MEANS OF THEIR LEAVES: Rev. It may be accomplished if a thin shield of wood be taken off with the leaf attached, but we know of no grower who adopts this method exclusively. They would require a top heat of 80°, bottom heat, 85° to 90°, and to be kept close under a bell-glass, or in a case, each leaf being fast to two sticks. The upper part of the shield should be above the sand of the propagating pan.

ERRATUM: HELICONIA ATREO-STRIGATA.—This plant was erroneously mentioned as coming from the Amazon district. It is not clear whether it is a native of New Guinea, or one of the South Sea islands. It is thriving at Kew.

GREENHOUSES: W. M. In the absence of agreement, you are liable to remove at three months' notice. The houses belong in law, to the landlord, if resting on brick foundations in the soil.

HEAD WORKING GARDENER: W. We are sorry not

to be able to help our correspondent; but we will keep the application before us in case of inquiry.

RICHTER'S IMPERATOR POTATO: A. P. It is a German variety. Stem vigorous, erect, stiff, tall. Leaves rather far apart with roundish plaited leaflets. Flowers lilac. A late mid-season variety not unlike Paterson's Victoria, but with larger and not so symmetrically formed tubers.

NAMES OF FRUITS: F. Hughes. Wadhurst Pippin.—H. Corder. Hanwell Souring.

NAMES OF PLANTS: W. C. Fordwich. 1. Crown Imperial, Fritillaria imperialis; 2. Erythronium dens canis, Dog-tooth Violet; 3. a Lily of some sort; 4. Hemerocallis, Day Lily; 5. Daphne mezereum; 6. not recognised.—J. H. 1. Saxifraga Wallacci; 2. Myrsiphyllum asparagoides; 3. Acer rubrum; 4. all wreathed scrubs.—J. F. Acacia lobata.—Miss F. Triteleia uniflora.—A. B. R. Tencium scordonia.—H. May. Yanda suavis: Veitch's variety.—A. McRae. Dendrobium nobile; very nice flowers. Thanks for sending them. We find no Odontoglossum, but two blooms of Colognye cristata.—H. Dunkley. Colognye cristata: probably the Tretham variety.—J. C. Cyripedium barbatum majus.—H. & B. Veronica Buxbaumii.—H. C. 1. Nigella arvensis; 2. Erucaria aleppica; 3. Fagonia arabica; 4. Ononis antiquorum; 5. Acacia albia; 6. Populus euphratica.

ORCHIDS: R. M.—The growth on your Dendrobium nobile, of which you complain is, doubtless, caused by improper conditions, especially with regard to ventilation. The Orchids mentioned in your list are not accepted as garden favourites.

TIN BOXES FOR PARCEL POST: W. McJ. Horticultural sundriesmen in a large way of business will supply you with them. Consult the list published in the Garden Annual or The Horticultural Directory.

TILPS PRODUCING LEAVES ONLY: C. T. A. The question was answered in our last issue, in Notices to Correspondents, and unfortunately in the present state of our knowledge of the subject there is nothing more to add to what is there stated.

VINE BORDER: Warwickshire. The soil sent presents the appearance of being quite worn-out, and is utterly unable to support a strong growing plant like the Vine. Inside borders require frequent additions and partial renewals, employing for this purpose the best turfy loam, mortar rubbish, crushed bones, charcoal, and mulching of rich manure annually. In this case, you should clear out the old soil, and make a new border 4 feet wide and 2 feet deep. See that the drainage is good before commencing to make up the border of the above-mentioned materials. Plant growing canes in May, and make additions to the width of the border whenever the roots reach the outside of it. The outside turves should be laid regularly in courses like brickwork.

WATER FROM ARTESIAN WELL: Atesian Well. Whether you will need a tank and from thence send the water, by means of a pipe, on to the tennis lawn, or send it direct, without the intervention of a receiving tank, is of no consequence; the point for you to ascertain is the force of the water sufficient to raise it to a height of 20 feet,—the height of the lawn above the point of issue. If it has that necessary force the difficulty vanishes. Water at 50° will do no harm to the turf in summer time.

YEW TREE: J. H. THE LEAVES are certainly injured by the poison, not from the transplanting. We fear nothing can be done, but to wait with a fair prospect of recovery.

COMMUNICATIONS RECEIVED.—E. P. GIBBT.—Our Berlin Correspondent.—Professor Hansen, Copenhagen.—F. W. R.—L. A.—J. B.—Our Swiss Correspondent.—E. C. B. (enquiry has been made).—F. P.—E. N.—J. K. H.—W. H. D. (many thanks).—A. D. W. (thanks).—J. M.—L. Mawdsley.—G. S.—W. E. D.—J. Wallis.—R. A.—R.—W. B. H.—J. R.—E. J.—A. K. (next week).—A. D.—F. A.—P. W.—W. H. S.—W. H. Y.—H. H. D.—W. C.—F. S. & Co.—F. Schulze & Co.—S. Goddard (we cannot undertake to notice every exhibit).—W. B. (next week).—J. B., Alderford.

DIED, on March 22, at The Ives, Wantage, WILLIAM CAUDWELL, in his sixty-eighth year. Friends will kindly accept this, the only intimation
